1 Specifications

Specification	Details
Product description	Meter controller, connected to the sensor to display measured values and upload data
Display	7-inch color LCD screen with touch function
Dimensions (W×H×D)	230 × 154 × 68 mm
Weight	1.9 kg
Power requirements	DC 24 V
Power	< 15 W (No sensor connected)
Protection class	IP65
Mounting	Wall-mounted
Operating temperature	-20 to 70 °C (-4 to 158 °F)
Storage temperature	-30 to 80 °C (-22 to 176 °F)
Data storage	32 GB
Interface	4-channel RS485 input, 1-channel RS485 output. 2 expansion ports, each expansion port support 2 channels of 4-20 mA or 4 channels of I/O (user optional 4-20 mA module or I/O module) 1-channel RJ45 output
Wireless Communication	WiFi (HTTP, MQTT protocol), 4G (user optional)
Warranty	One year

4G module, 4-20mA, I/O modules need to be purchased additionally.

1.1 Accessory

Specification	Details
Power adapter	Input Voltage: 100-240 VAC, 50/60Hz, 1.3A Output voltage: 24V, 3.75A, 90 W (Max) Dimensions: 145×60×32 mm

In no event will the manufacturer be liable for direct, indirect, special, incidental or consequential damages resulting from any defect or omission in this manual. The manufacturer reserves the right to make changes in this manual and the products it describes at any time, without notice or obligation.

2 General information

2.1 Safety information

Please read this entire manual before unpacking, setting up or operating this equipment. Pay attention to all danger and caution statements. Failure to do so could result in serious injury to the operator or damage to the equipment. Make sure that the protection provided by this equipment is not impaired. Do not use or install this equipment in any manner other than that specified in this manual.

2.1.1 Use of hazard information

 DANGER
Indicates a potentially or imminently hazardous situation which, if not avoided, will result in death or serious injury.
 WARNING
Indicates a potentially or imminently hazardous situation which, if not avoided, could result in death or serious injury.
NOTICE
Indicates a situation which, if not avoided, may cause damage to the instrument. Information that requires special emphasis.

2.1.2 Precautionary labels

Read all labels and tags attached to the instrument. Personal injury or damage to the instrument could occur if not observed. A symbol on the instrument is referenced in the manual with a precautionary statement.

	This symbol, if noted on the instrument, references the instruction manual for operation and/or safety information.
	This symbol indicates that a risk of electrical shock and/or electrocution exists.
	This symbol indicates the connection location of protective earth.

Note: This series of products are mainly used in industrial environments, indoor use, which will cause potential electromagnetic interference to the environment. This series of products meets the relevant requirements of the standards EN 61326-1: 2013 and EN 61326-2-3: 2013.

2.2 Product overview

The MC-W-S is a meter controller with a 7-inch color LCD screen, which can connect multiple sensors at the same time. Users can quickly connect the sensors to meter controller, configure the parameter of sensors. MC-W-S display data and graphs in real-time. MC-W-S supports wireless data output, can upload the collected data to the cloud (SPS-Server), supporting HTTP protocol, MQTT protocol meanwhile.

The software system is an Android application developed based on the Android environment.

Figure 2.1 Product description

2.3 Dimensions

Figure 2.2 Meter controller dimensions

3 MC-W-S interface

⚠ WARNING	
	Multiple dangers. Only qualified personnel must conduct the tasks described in this section of the document.
⚠ WARNING	
	Be careful not to get electrocuted when connecting the sensor.

3.1 External 4G antenna interface

There is an SMA antenna interface on the upper right of the device. When the meter controller is placed in a confined space, an extension cable can be connected to enhance the 4G signal.

Figure 3.1 Antenna Interface

3.2 Internal board interface

The internal board of the device has 4 RS485 input interfaces, 2 expansion ports, power input and RS485 output interfaces. 4 RS485 input interfaces have a jumper cap in the upper left corner, which can be installed to choose DC 24 V or DC 12 V power supply output according to the power supply requirements of the connected equipment. The jumper cap inserted on the left side is for DC 24 V power supply output, and the jumper cap inserted on the right side is for DC 12 V power supply output.

3.2.1 MC-W-S interface

Figure 3.2 Internal Interface

Table 3.1 Internal Interface Pin Definition

Port	Pin#	Name	Description	Connected equipment
Slave 1	1	VCC	DC 24 V power supply output positive	Sensor/Slave Primary port ttyS4
	2	GND	DC 24 V power supply output negative	
	3	NC	Undefined	
	4	A+	RS485 A+	
	5	B-	RS485 B-	
	6	PE	Ground

3.3 Nano-SIM card slot and SD card slot

MC-W-S is equipped with Nano-SIM card slot and SD card slot. Insert the Nano-SIM card, the MC-W-S will automatically connect to the network and upload the data to the cloud platform. By default, the company's cloud platform is uploaded. To switch other data platforms, please check the configuration information. MC-W-S comes standard with a 32 GB SD card.

Supports USB flash drive for reading and writing files, RJ45 port, Type-C and Micro USB for connecting devices.

Note: 4G modules are optional according to user requirements and will be configured according to the location of use. Please inform us before purchasing, otherwise it may not work.

Note: Insert the SD card or remove out the SD card when the device is powered on, the device will reboot automatically, please note Save the configuration in advance.

3.4 Coin cell battery installation

Figure 3.5 Coin cell battery mount

A coin cell battery, 3V CR1220, must be installed on the back of the meter controller screen.

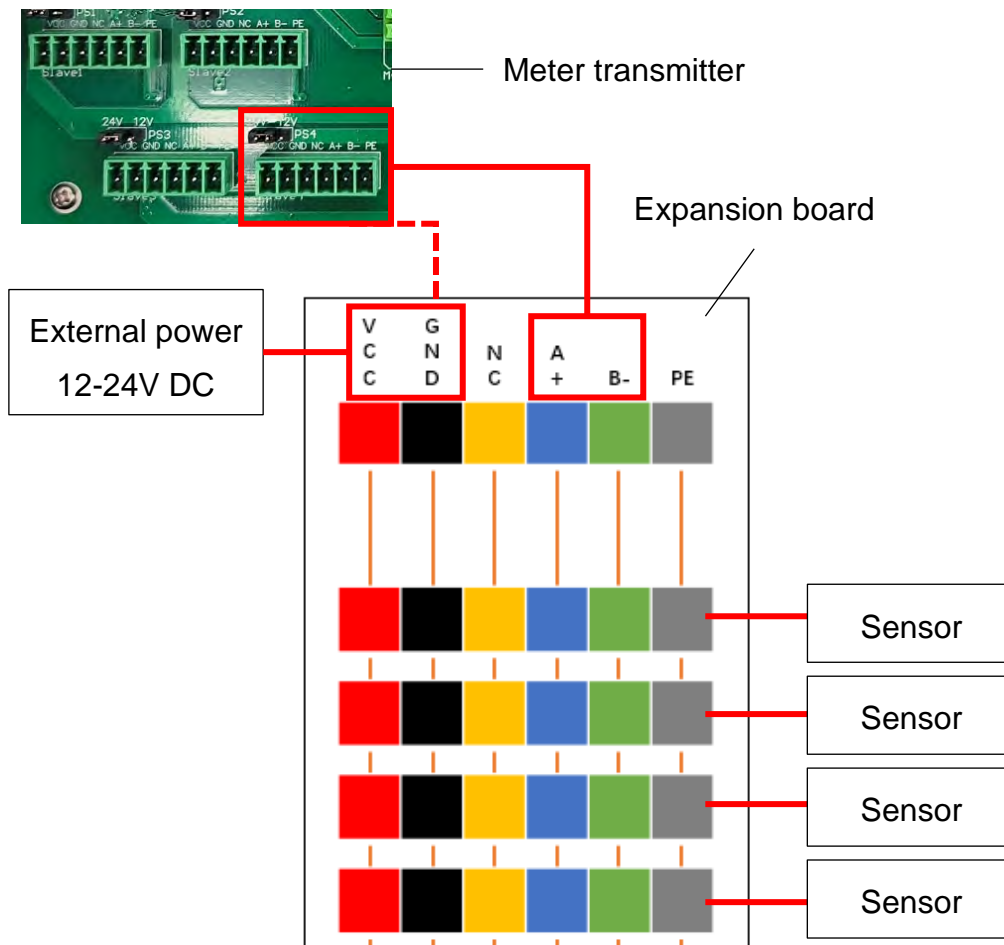

When installing, you need to pay attention that the positive side of the coin cell battery faces up, as shown in the picture, there is a positive contact plate on the left side of the battery holder, first electromagnetic tilt to the right against the battery, press the battery until flat.

3.5 Expansion connection

⚠ WARNING	
	<p>Multiple dangers. Only qualified personnel must conduct the tasks described in this section of the document.</p>
NOTICE	
<p>Expansion board external power supply, please purchase our grounded power supply, if not, please connect the external power supply, do not exceed the rated voltage of the sensor, to prevent damage to the sensor.</p>	
NOTICE	
<p>Refer to section 3.2.1 for wiring definitions.</p>	

The total power of the devices connected to the meter head should not exceed 36 W. If additional sensors are to be connected, the expansion board can be prepared by connecting the signal lines to the meter head A+, B- and the external power supply of the expansion board.

If the external power supply is not earthed, connect the expansion board GND and the meter transmitter GND.

4 Installation

WARNING

Multiple dangers. Only qualified personnel must conduct the tasks described in this section of the document.

4.1 Wall-mounted

5 Connect the sensor

WARNING

Multiple dangers. Only qualified personnel must conduct the tasks described in this section of the document.

5.1 Sensor/slave connection

1

● SPS series sensor connection

Take SPS-T-SC3 sensor as an example. The interfaces that can be connected are Slave 1, Slave 2, Slave 3, and Slave 4.

- **Other sensor connection methods**

MC-W-S meter controller can be connected to other manufacturers' sensors.

Other manufacturers' sensor requirements are as follows:

Power supply:	DC 12 V/DC 24 V
Protocol:	Modbus RS485
Power:	<5 W
Available interfaces:	Slave 1, Slave 2, Slave 3, Slave 4

Note: For detailed interface definition and distribution, see [3 MC-W-S interface](#).

5.2 Power connection

MC-W-S meter controller power supply is DC 24 V, internal interface is PowerCom, RS485 output interface is also at the PowerCom interface, connected according to the interface definition.

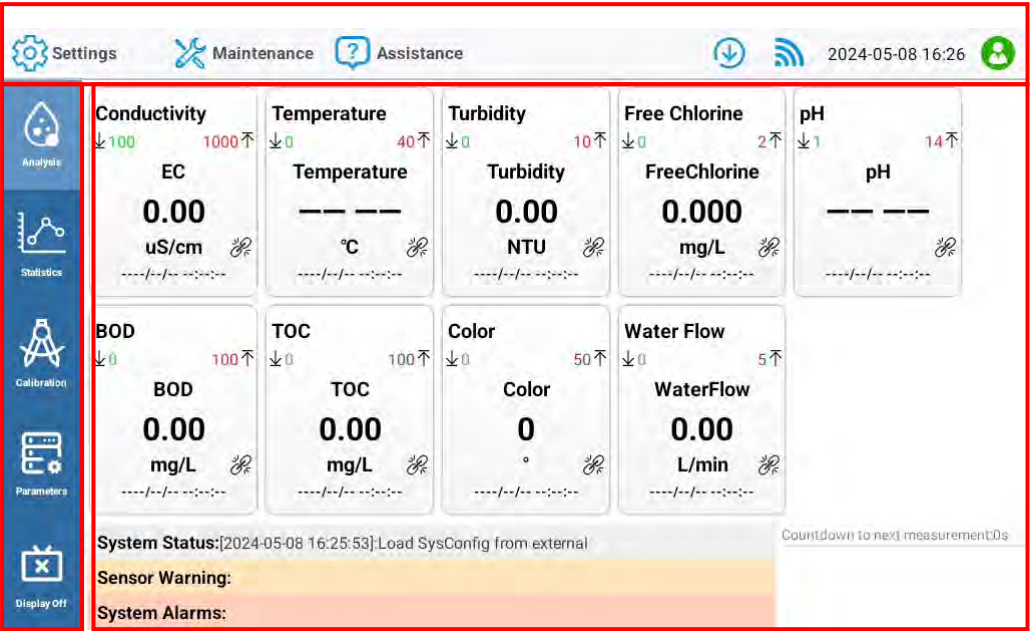

6 Quick access

NOTICE
The display is a touch screen, so touch it lightly to operate.
NOTICE
The interface guide images in the text are only examples, please refer to the actual user interface received.

6.1 Introduction to the interface

The interface consists of three main blocks: the menu bar, the navigation bar, and the display area.

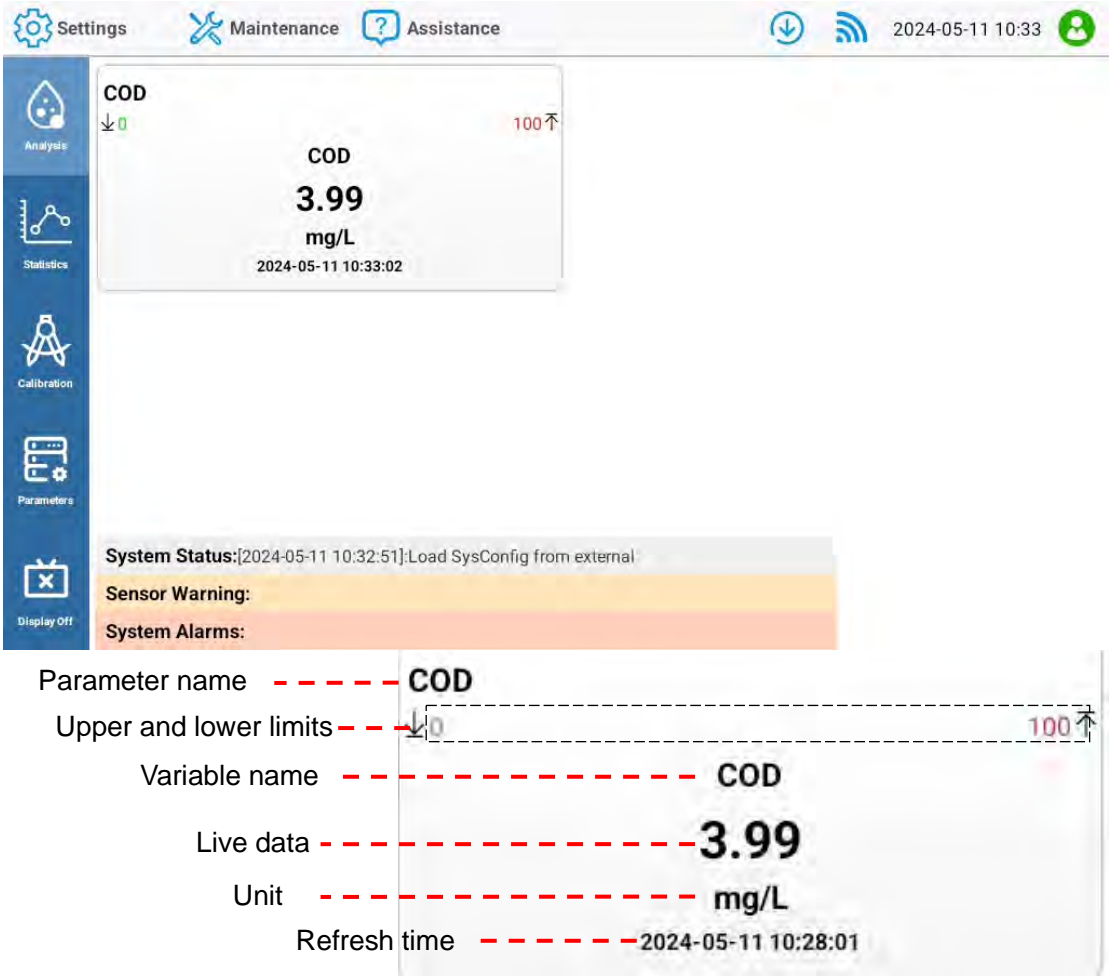

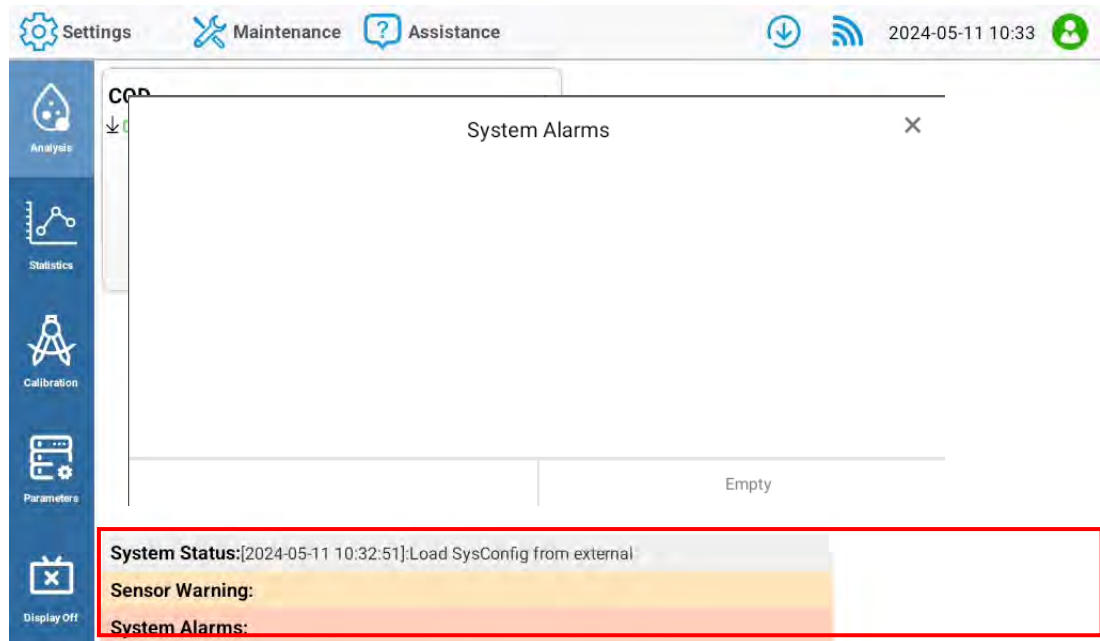

Note: Changing parameter settings requires the appropriate rights
Engineer: can check data, maintenance, calibration and other operations,
initial password: 123456
Administrator: has all modification rights, initial password: 12345678

6.2 Analysis page

The Analysis page displays real-time data for each of the device's parameters. The page is composed of the data displayed by each sensor access screen. Each panel represents a parameter value and the display consists of the parameter name, real-time value, unit and update time.

The Analysis page display consists of the configurations in 7.6.1.2 [Analysis page management](#).

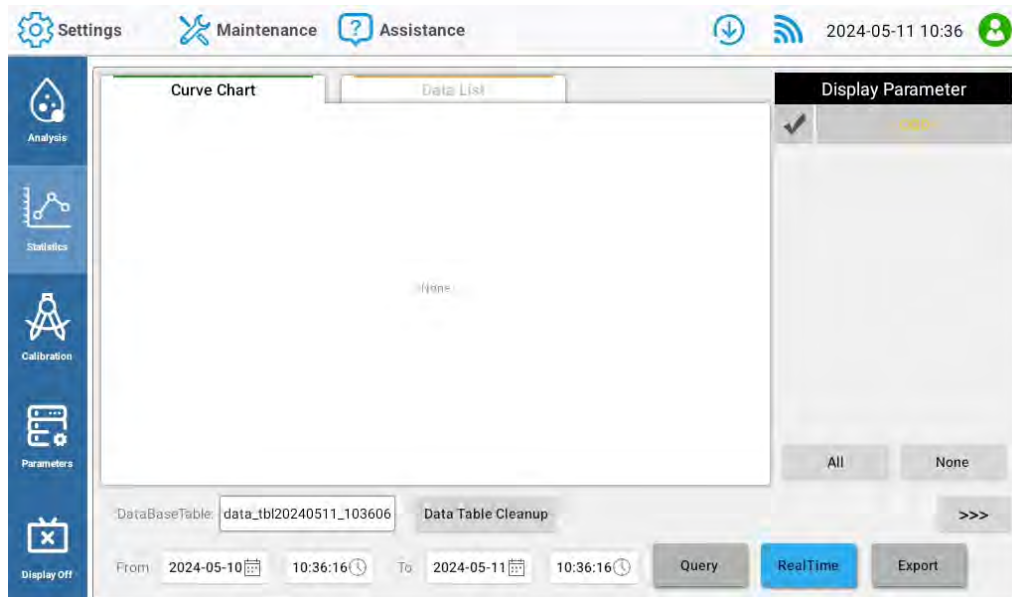

The bottom section is the status display area, which contains three sections: System Status, Sensor Warning, and System Alarm.

Click on the appropriate area to view the status record.

System Status	Load SysConfig from internal Load SysConfig from external Engineer login successful Admin login successful
Sensor Warning	Parameter failed to read Probe value is too high Probe value is too low
System Alarm	Liquid leak alarm Lua Result Type Error: [Lua Script] Lua Error: [Lua Script] The storage space is less than 200MB

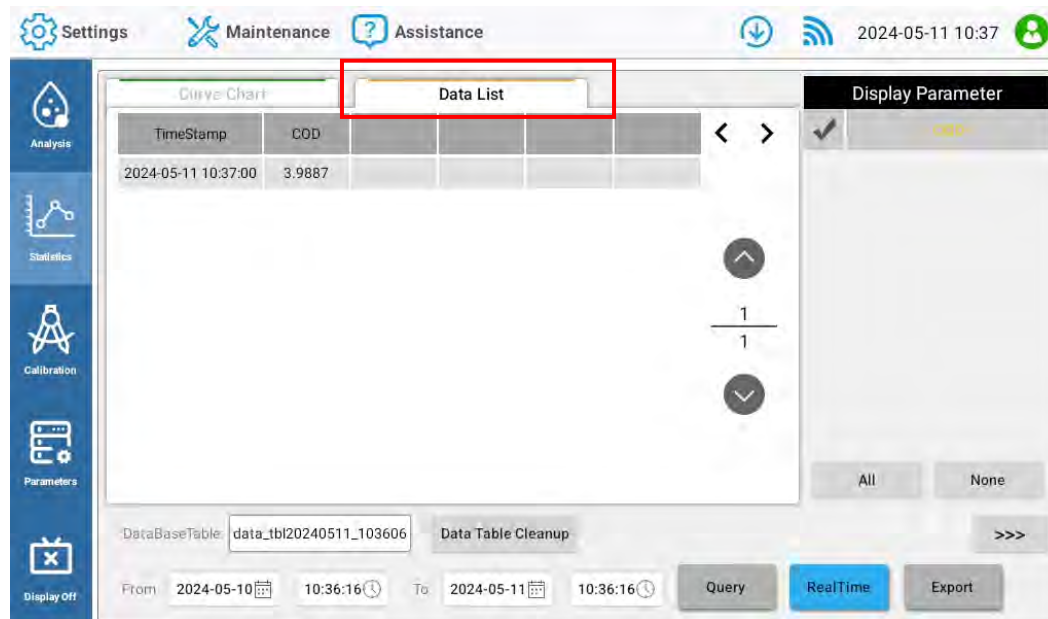

6.3 Statistics page

This page displays graphs and charts of the various data curves, making it easy for users to view data trends.

- Click on the ">>>" button on the right side to open the list of legends, click on a legend to show and hide the corresponding curve.
- Click on the "All" button to select all panel data and the "Select None" button to cancel all.
- Click on the "Query" button to display historical data for a specified period.
- Click on the "RealTime" button to display the most recent day's data and refresh it regularly.
- Click on the "Data Table Cleanup" button to clear the historical data.
- Click on the 'Export' button to export historical data for a specified period of time.

The content of the Statistics page consists of the configurations in 7.6.1.4 [Statistics page management](#).

Click on the data list to view specific data records.

6.4 Calibration page

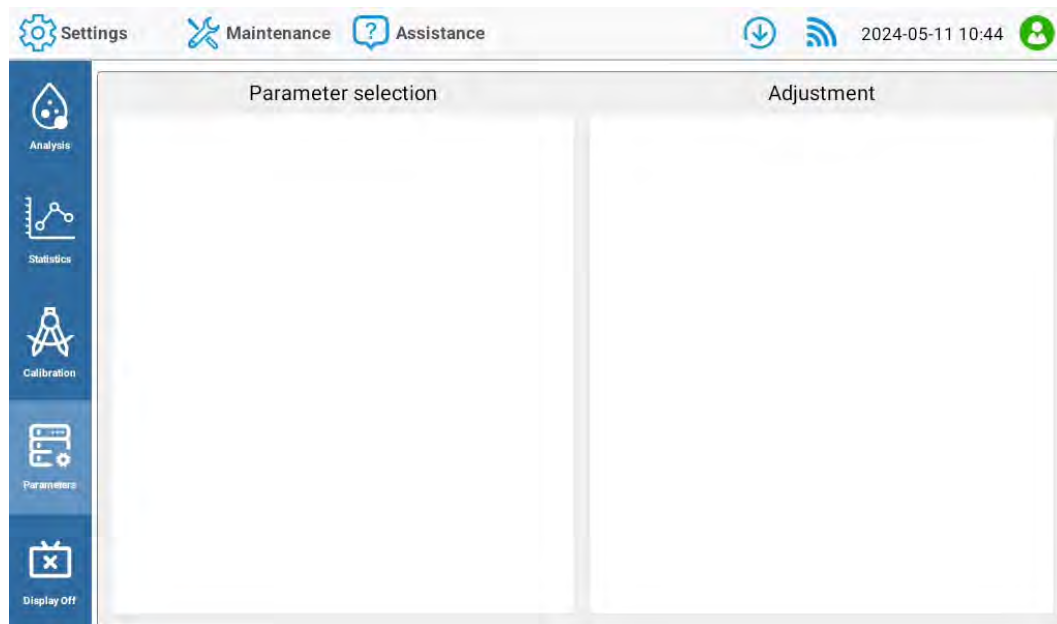

Equipment selection	Parameter selection	Calibration
Multi-Parameter Sensor	Turbidity	Turbidity: 0.000
EC	BOD	Raw value: 0.000
pH	Color	Slope: 1.000
fCl	TOC	Zero: 0.000
		Submit

Technical Tips

The Calibration Page is the device control and calibration page that is set up according to the sensor calibration instructions, and the calibration data is stored in the sensor.

The contents of the calibration page consist of the configurations in 7.6.1.5 [Calibration page management](#).

6.5 Parameter page

Operations such as sensor range switching and cleaning brush control can be set.

The contents of the Parameter page consist of the configurations in 7.6.1.6 [Parameter page management](#).

7 MC-W-S UI introduction

NOTICE

The interface guide images in the text are only examples, please refer to the actual user interface received.

7.1 Start

This device is a Modbus protocol universal meter controller, in addition to supporting SPS series sensors, it also supports the connection of other Modbus slaves, which are configured by the user.

The configuration in the manual is only an example, the device is generally shipped with the appropriate configuration added by default, which is adapted to the sensors purchased by the user.

7.1.1 Framework

The register map list and CMD for each Modbus device run according to the set parameters. The input page, chart page, output page, and calibration page are bound to the device's registers for displaying register values, changing register values, and executing CMD.

- 1) Device Management:
 - a) Device: modbus slave
 - i. Register map list: execution by function code
 1. Register: store the corresponding register data of the device
 - ii. CMD: execution by CMD type
- 2) Display Page:
 - a) Analysis page: real-time display of device data
 - b) Statistics page: record device data and display it in a graph
- 3) Control Page:
 - a) Output page: automatically write registers or execute CMD
 - b) Calibration page: calibration of the measured value for the slave
 - c) Parameter page: manually read or write registers or execute CMD

7.1.2 Data binding sources

Data binding source for the analysis page: Device.

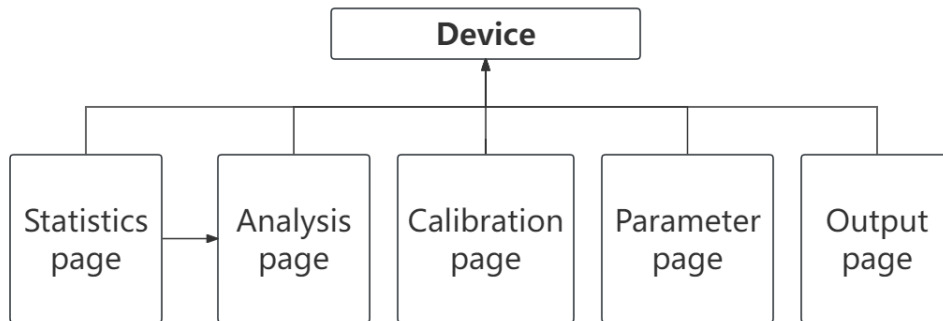

Data binding source for output page: Analysis page or device.

Data binding source for calibration page: Analysis page or device.

Data binding source for statistics page: Analysis page or device.

Data binding source for parameter page: Analysis page or device.

Note: Changing the object name or deleting the object may invalidate the data binding, so please modify the corresponding data binding.

7.1.3 Model and trigger

In this device, both the model and the trigger use the Lua scripting language, the difference is that the returned value of the model is a numeric value, and the returned value of the trigger is a boolean value.

The script's execution entry is the main function, for example:

```
function main ()  
--<body>  
end
```

7.1.3.1 Referencing register data

The internal function `com.getDevV("register path")` is needed.

Register path: "device name/RegMapList/register map list name/register name".

To return COD register as an example.:

```
function main ()  
    return com.getDevV ("Sensor_COD /RegMapList/WQP/COD_KHP")  
end
```

7.1.3.2 Referencing input page panel data

The internal function `com.getPanelV ("panel path")` is required.

Panel path:

When the panel is in the top level: the panel name.

When the panel is in a group: "group name/.../panel name"

```
function main ()  
    return com.getPanelV ("COD")  
end
```

7.1.4 Configuration process

- 1) Add devices, register table, registers and CMD in Device manager.
- 2) Add panel in analysis page (need to bind to the register).
- 3) Add panel in output page (need to bind to the register or analysis page).
- 4) Add group, calibration, calibration members in calibration page (need to bind to the register or analysis page).
- 5) Add data cell statistics page (need to bind to the register or analysis page).
- 6) Parameter page to add device control or read analysis page (need to bind to the register or analysis page).

7.2 Menu bar

7.3 Online update

When the icon  in the status bar blinks, it means there is a new update, click the icon to view the update information.

7.4 WiFi

Click the icon  in the status bar to open the WiFi settings screen.

If the icon  turns gray, the current network is abnormal.

Note: Internet environment is required for software update and time synchronization.

7.5 User login

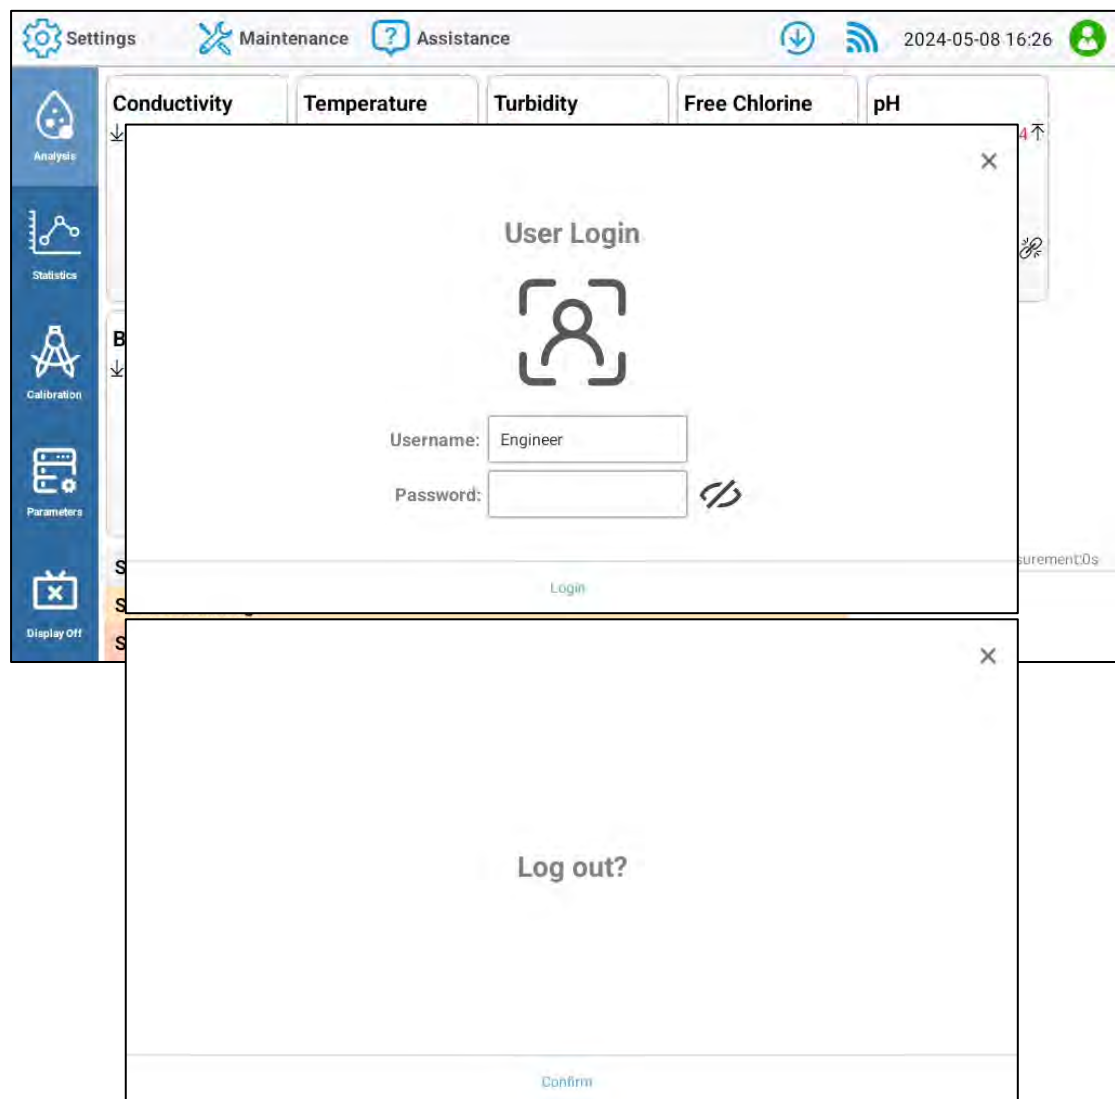

Click on the status bar icon  to log in as an **Engineer** or **Admin**.

The **Engineer** is responsible for the maintenance and calibration of the sensor.

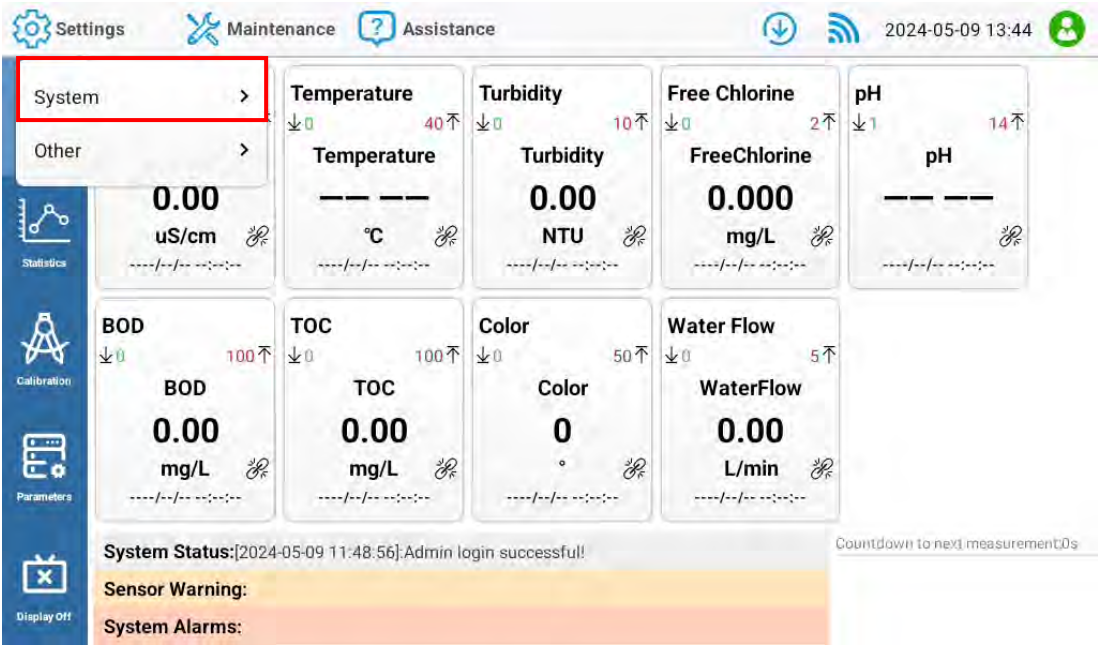

The default password is 123456 and the icon  changes to blue after logging in.

The **Admin** has higher privileges and can edit the layout configuration. The password is 12345678 by default and the icon  changes to green after logging in.

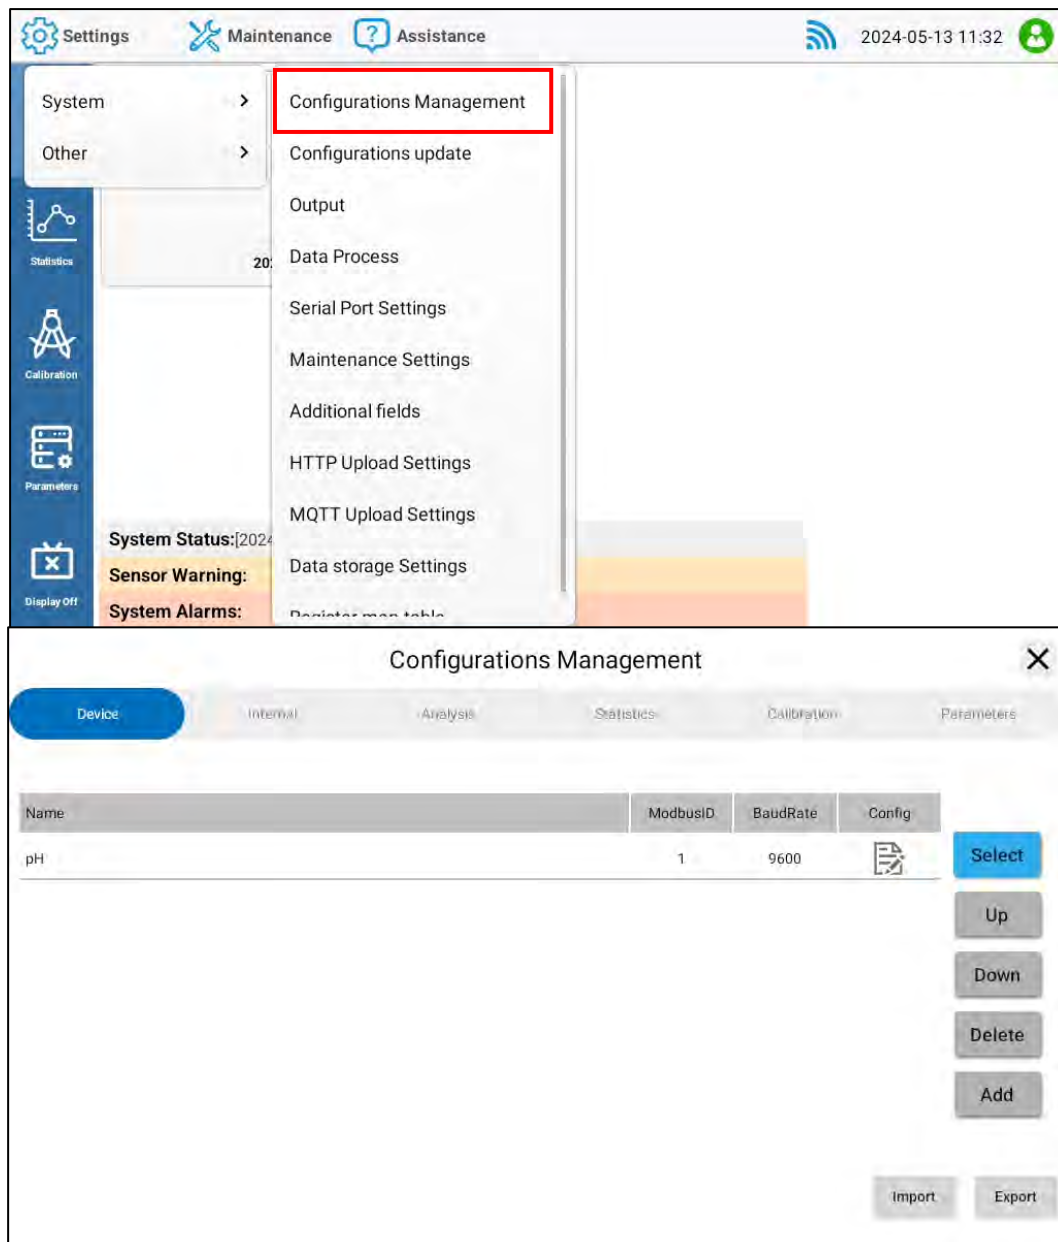

Once you have logged in, you can log out by clicking on the icon again.

7.6 System settings

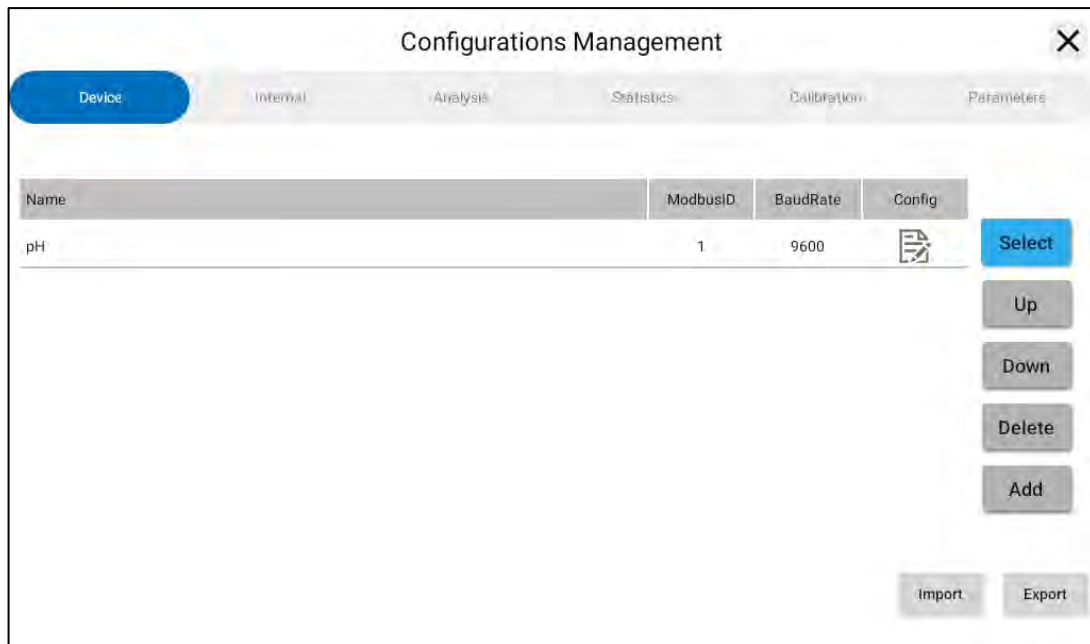

7.6.1 Configurations management

Configuration management allows you to configure devices, analysis pages, statistics pages, calibration pages, and parameter pages.

7.6.1.1 Add device

The 'Configurations Management' window features a tabbed interface with 'Device' selected. It contains a table with columns: Name, ModbusID, BaudRate, and Config. A single row is visible with 'pH' as the name, '1' as the ModbusID, and '9600' as the BaudRate. To the right of the table are buttons for 'Select', 'Up', 'Down', 'Delete', and 'Add'. At the bottom right are 'Import' and 'Export' buttons.

Name	ModbusID	BaudRate	Config
pH	1	9600	

Select mode: Click Select to enter the selection mode, which allows you to move or delete the devices edited on the left.

Up: Moves the selected device configuration up.

Down: Moves the selected device configuration down.

Delete: Deletes the selected device.

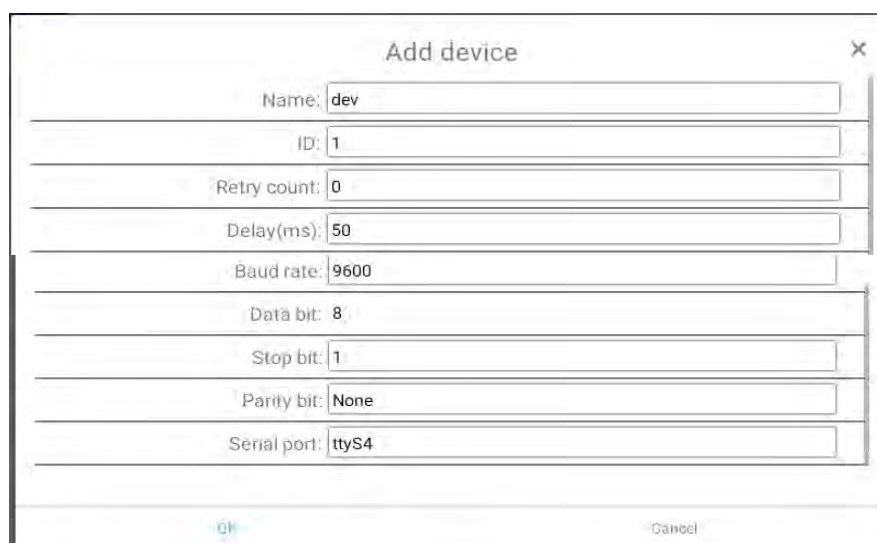

Add: Add a new device configuration.

Import: Imports a previously written device configuration.

Export: Exports the currently written device configuration.

: Edit device information or register.

Add device

The 'Add device' dialog box contains the following fields:

- Name: dev
- ID: 1
- Retry count: 0
- Delay(ms): 50
- Baud rate: 9600
- Data bit: 8
- Stop bit: 1
- Parity bit: None
- Serial port: ttyS4

Buttons at the bottom: OK, Cancel.

Name: Device name, not repeatable.
 ID: Device ID, not repeatable.
 Retry count: The number of times the device fails to communicate and attempts to reconnect.
 Delay (ms): Communication delay of the device.
 Baud rate: Device baud rate.
 Data bit: 8.
 Stop bit: 1 or 2.
 Parity bit: None, Odd, Even.
 Serial port: None (Unassigned ports), ttyS4 (Primary port), ttyS9 (Expansion module port). See 3.2 [Internal board interface](#) for port definitions.

Add register

The screenshot shows the 'Configurations Management' window with the 'Device' tab selected. Below the tabs, there is a 'RegMap' button highlighted with a red box. A table below it shows a single entry for 'regMap' with a green status indicator, '0x03' for Fun, and '0' for Address. To the right of the table is a 'Select' button. Below the table, the 'Add register table' dialog is open, showing various configuration fields for the 'regMap' register table. The 'Add' button in the dialog is also highlighted with a red box.

Name	Enable	Fun	Address	Config	Select
regMap	●	0x03	0

Add

Import Export

The screenshot shows a dialog box titled "Add cmd" with a close button (X) in the top right corner. The dialog contains the following fields and controls:

- Name: cmd
- Command type: TypicalCMD
- Protocol parsing type: None
- Timeout(ms): 200
- Interval(ms): 10000
- Loop Enable: ☐
- Trigger(Lua):
- Trigger Mode: Hold
- Trigger Enable: ☒
- Trigger delay(s): 5
- Start address: 0
- Symbol: 0
- Var: 0
- Bytes: -

At the bottom of the dialog are two buttons: "OK" and "Cancel".

Name: Register name, not repeatable.

Command Type: TypicalCMD, CustomCMD.

Protocol parsing type: None, SAC.

Timeout(ms): Register read timeout, after the timeout, the device will show offline.

Interval(ms): Loop command execution interval.

Loop Enable: Switches for looping through command.

Trigger(Lua): Script editor.

Trigger Mode: Hold, Rising Edge, Falling Edge.

Trigger Enable: Script trigger enable switch.

Trigger delay(s): Delay for trigger execution.

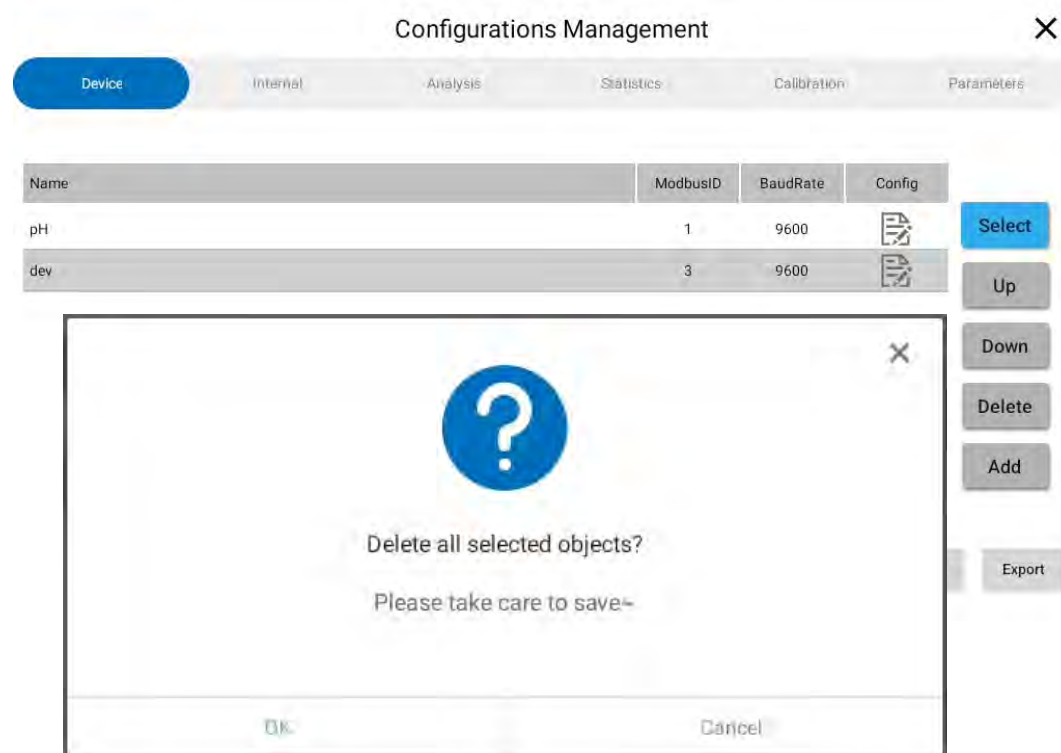

Start address: Start address of command register, query device command register table.

Symbol: Command value high 8-bit, query device command register table.

Var: Command value low 8-bit, query device command register table.

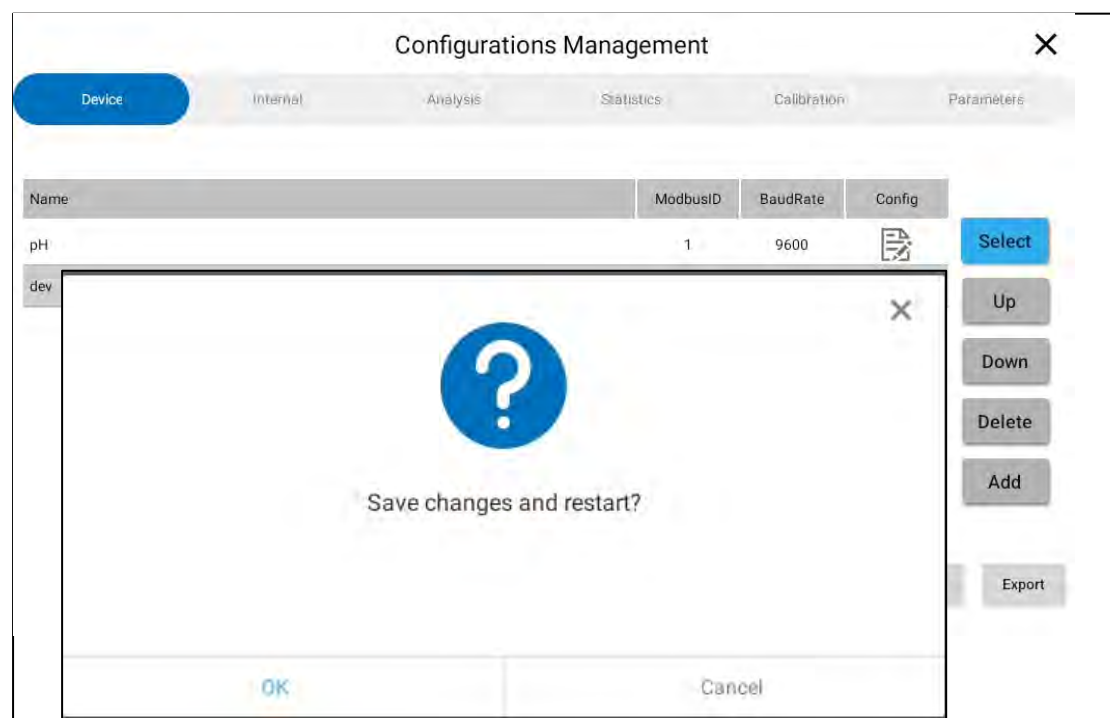

Bytes: Custom send bytes (CustomCMD can only be executed).

Delete device

If there are devices or registers to be deleted, click Select, select the device to be deleted, and click Delete.

Save configuration

When the configuration is complete and you exit Configuration Management, you will be prompted to save the changes, click OK to save the configuration.

7.6.1.2 Analysis page management

Add group (if you don't need group, you can skip this step.)

The screenshot shows the 'Configurations Management' window with the 'Analysis' tab selected. The 'Add Item' dialog is open, and the 'Add group' option is highlighted with a red box. Below it, the 'Add group' dialog is shown with the following fields:

Name	Type	Note	Unit	Config
pH	Panel	pH		

The 'Add group' dialog has the following fields:

- Name: group
- Note:
- Mark:

Buttons: OK, Cancel

Click Add and select Add group.

Name: Name of the group, cannot be repeated.

Note: Remark 1.

Mark: Remark 2.

Add panel

The screenshot shows the 'Configurations Management' window with a top navigation bar containing 'Device', 'Internal', 'Analysis' (selected), 'Statistics', 'Calibration', and 'Parameters'. Below the navigation bar is a breadcrumb trail '/group' and a 'Panel' tab. A table with columns 'Name', 'Type', 'Note', 'Unit', 'Config', and 'Select' is visible. The 'Add Item' dialog box is open, showing a list of items: 'Add panel' (highlighted with a red box) and 'Add group'. The 'Add panel' dialog box is also open, showing fields for 'Name' (panel), 'Parameter name', 'Unit', 'Decimal Digits' (0), 'Data binding', 'Data Type' (Auto), 'Upper limit' (0), 'Low limit' (0), 'Zero' (0), 'Slope' (1), 'Default save' (checked), and 'Model'. The 'Add' button is visible on the right side of the 'Add Item' dialog box.

Click Add and select Add Panel.

Name: Variable name, meter controller upload name, not repeatable.

Parameter name: Parameter name, it could be repeated.

Unit: The unit of the parameter.

Fractional Digits: The exact number of decimal digits for the parameter.

Data binding: Select the parameter register in the instrument configuration.

Upper Limit: Set the upper limit of the parameter register alarms.

Lower Limit: Set the lower limit of the parameter register alarms. If the upper and lower values are not equal, the device will automatically add the parameter's status register.

Zero: Parameter offset, default 0.

Slope: Parameter slope, default 1.

Default save: Database storage statistics switch, on by default.

Model: parameter display script editing (default none).

7.6.1.4 Statistics page management

1. Click Import in the upper right corner to quickly add the parameters of the bound analysis page.

2. Click Add to add the parameters to be displayed in the statistics page.

Name: The name of the parameter, cannot be repeated.

Data Binding: The data source to which the parameter is bound.

Note: Only if the statistics page is not configured in any way and the device configuration is completed to close the device management, the system will automatically load the parameter items that are stored by default in the analysis page.

7.6.1.5 Calibration page management

Add device group

The screenshot shows the 'Configurations Management' dialog box with the 'Calibration' tab selected. The 'Typical' group is highlighted. The 'Add group' modal is open, showing fields for 'Name' (pH) and 'Mark' (empty). The modal has 'Add' and 'Cancel' buttons.

Name	Mark	Config	Select
pH			

Name: Device name, not repeatable.

Mark: Remarks.

Add parameter group

The screenshot shows the 'Configurations Management' dialog box with the 'Calibration' tab selected. The 'Typical' group is highlighted. The 'Edit panel' modal is open, showing fields for 'Name' (pH standard solution calibration), 'Type' (Typical), 'Mark' (mark), 'Technical Tips' (tips), 'Fractional Digits' (0), and 'Data binding' (empty). The modal has 'OK' and 'Cancel' buttons.

Name	Type	Mark	Config	Select
pH actual water sample calibration	Typical	mark		
pH standard				

Name: Panel name, not repeatable.

Type: Typical, Linear, SlopeZero.

Marker: Remarks information.

Technical Tips: Note message.

Fractional digits: Fractional digits.

Data binding: Data source binding (only linear and slope offsets need to be used).

Add calibration sub-option

Decimal digits: Number of decimal digits to display.

Display type: Numeric, Input box, Button, Switch, Block button.

Model: Script editing.

Data Binding: Bind to a data source.

7.6.1.6 Parameter page management

Add group

The screenshot displays the 'Configurations Management' dialog with the 'Parameters' tab selected. Below the tab bar is a table with columns 'Name', 'Mark', and 'Config'. An 'Add Parameter' sub-dialog is open, showing input fields for 'Name' (containing 'para') and 'Mark'. To the right of the table are buttons for 'Select', 'Up', 'Down', 'Delete', 'Add', 'Import', and 'Export'. The 'Add Parameter' dialog has 'OK' and 'Cancel' buttons at the bottom.

Name: Parameter name.

Marker: Remarks information.

Add subitem of parameter

The screenshot shows the 'Configurations Management' window with the 'Parameters' tab selected. A table lists parameters, with one row highlighted: Name: item, Type: Numeric, Value: 0, Subitem: Invalid. An 'Add' button is visible next to the table. A modal dialog titled 'Add Subitem Of Parameter' is open, containing the following fields: Name (item), Value (0), Max (0), Min (0), Re-execution delay(s) (0), Re-execution value (0), Fractional Digits (0), Display type (Numeric), Unit, Model, Lua Script, and Data binding. The dialog has 'OK' and 'Cancel' buttons at the bottom.

Name: Parameter name, not repeatable.

Value: If the display type is a button, the target value is sent when clicked.

Max: The upper limit of the set value when the function is to read or write the value.

Min: Lower limit of the set value when this function reads or writes the value.

Re-execution delay(s): Re-execute the delay.

Re-execution value: Value sent on re-execution.

Fractional Digits: This function displays the number of decimal places for numeric values.

Display type: Numeric, Input box, Button, Switch, Block button.

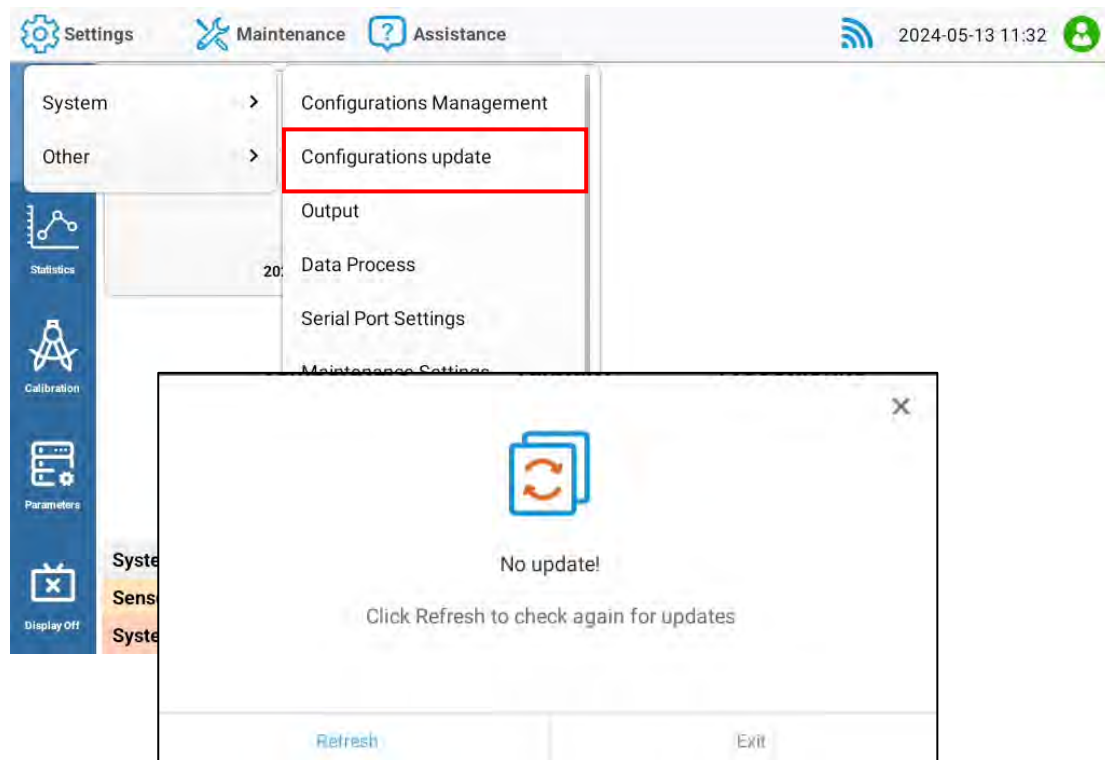

Unit: Parameter unit.

Model: Processing the raw data.

Lua Script: If the parameter object is of type button and the data binding is empty, clicking on the button will execute the Lua script.

Data binding: Binding data sources.

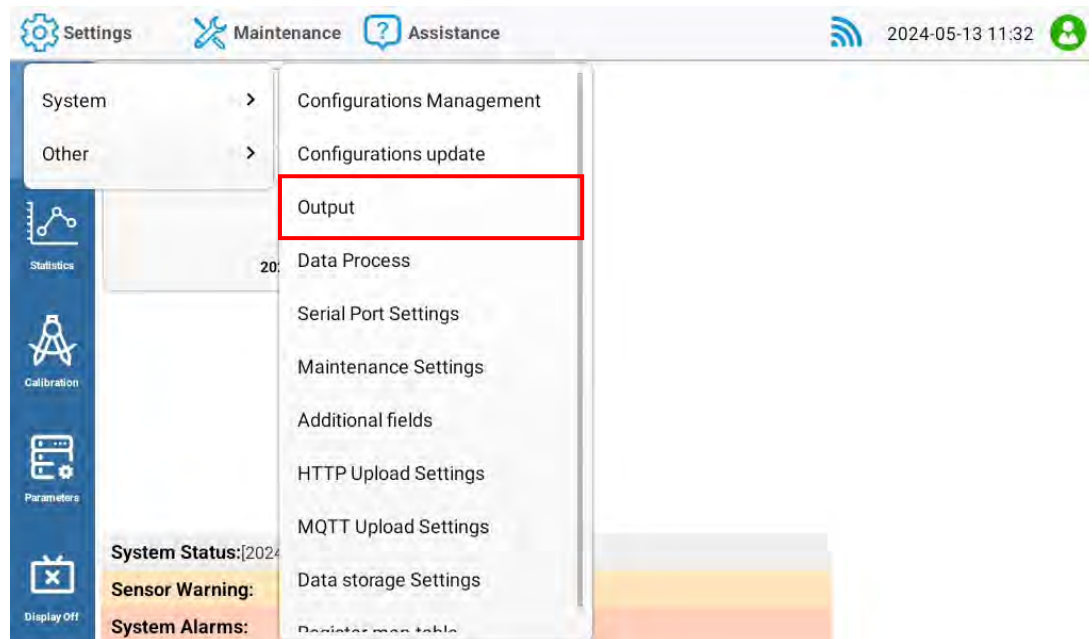

7.6.2 Configurations update

Click this setting to retrieve the device's configuration information from the network.

7.6.3 Output configuration

Click output configuration to access the analog output settings for the meter controller.

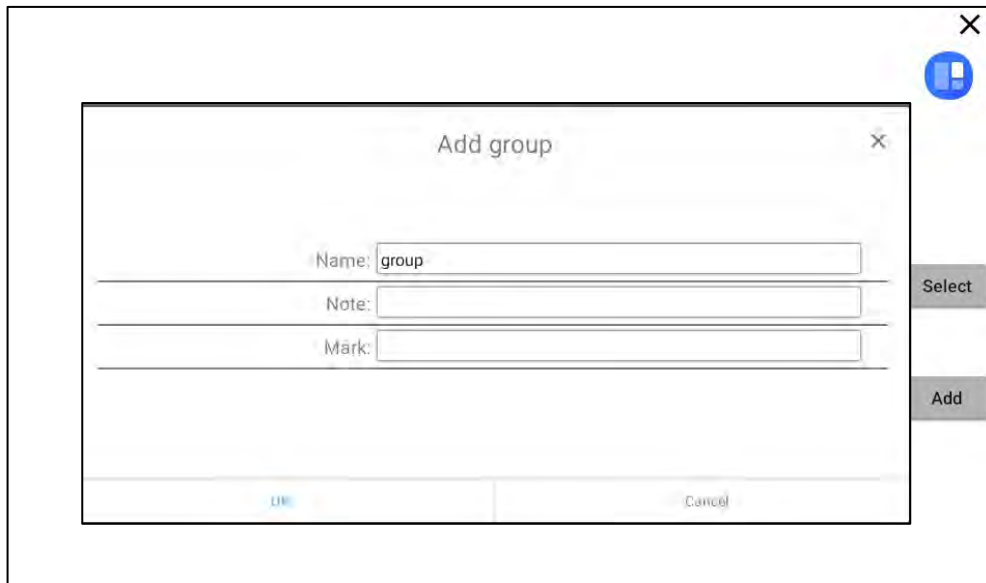

Click Add and select Add group or Output.

Add output: Add the desired output parameter panel directly.

Add group: After adding the desired output parameter group, add the output parameter.

Add group

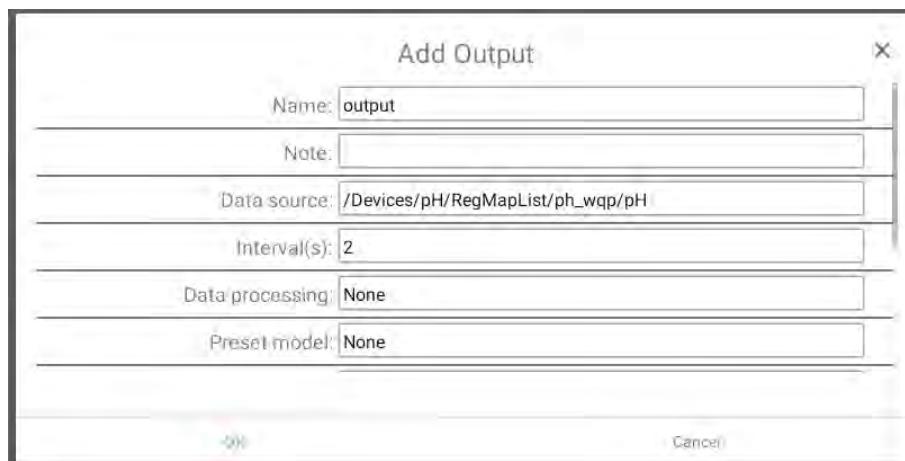

Name: Group name, not repeatable.

Note: Remarks 1.

Mark: Remarks 2.

Add output

Name: Parameter name, not repeatable.

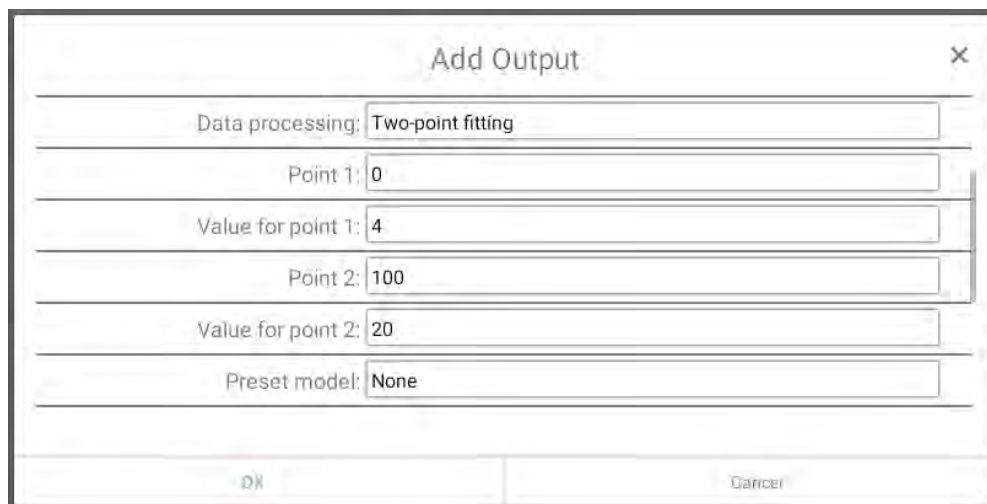

Note: Remarks.

Data source: Binding to the parameter for which the analog output is required

Interval(s): Data refresh interval.

Data processing: (A) None, (B) Two-point fitting, (C) Lua Script (Only works if the preset model is none).

Data processing choose (B) Two-point fitting. Preset model is none.

The 'Add Output' dialog box is shown with the following settings:

- Data processing: Two-point fitting
- Point 1: 0
- Value for point 1: 4
- Point 2: 100
- Value for point 2: 20
- Preset model: None

Buttons at the bottom: OK, Cancel

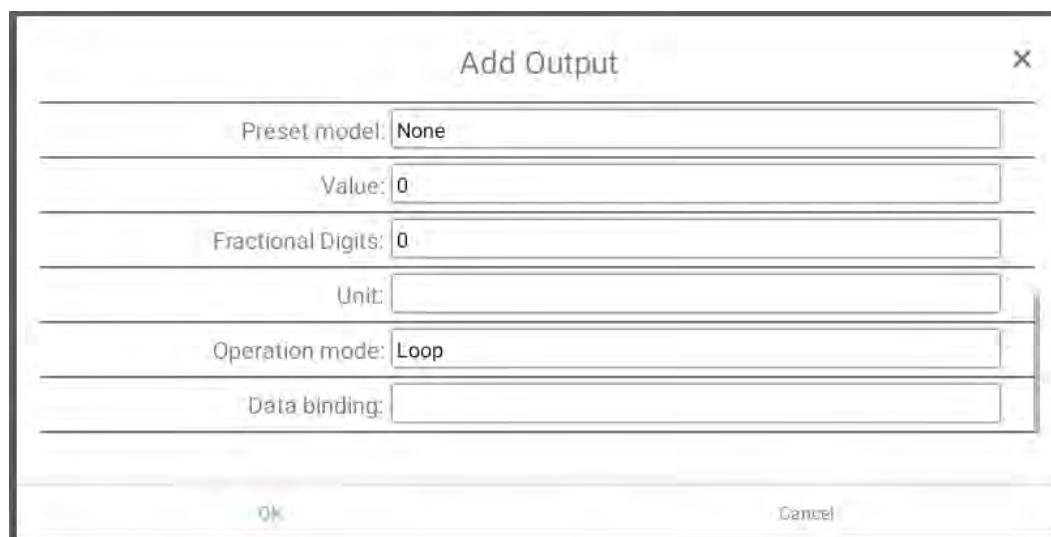

Point 1: Lower limit of the range to be output, e.g. 0 mg/L

Value for point 1: Current value corresponding to the lower limit of the range, e.g. 4 mA

Point 2: Upper limit of the range to be output, e.g. 1 mg/L

Value for point 2: Current value corresponding to the upper limit of the range, e.g. 20 mA

Data processing is (A) None or (B) Two-point fitting. Preset model is None.

The 'Add Output' dialog box is shown with the following settings:

- Preset model: None
- Value: 0
- Fractional Digits: 0
- Unit:
- Operation mode: Loop
- Data binding:

Buttons at the bottom: OK, Cancel

Value: Output fixed value.

Fractional Digits: Number of decimal places.

Unit: Parameter unit.

Operation mode: Loop (Periodically acquires and outputs signals at set intervals), Stop (Turn off the signal output of this channel), Once (Turns off after executing one signal output).

Data binding: Bind the path to the appropriate analog output module.

Data processing is (A) None or (B) Two-point fitting. Preset model is Out of Rang.

Delay(s): Output delay

Low-value: Setting the lower limit of analog output

Upper value: Setting the upper limit of analog output

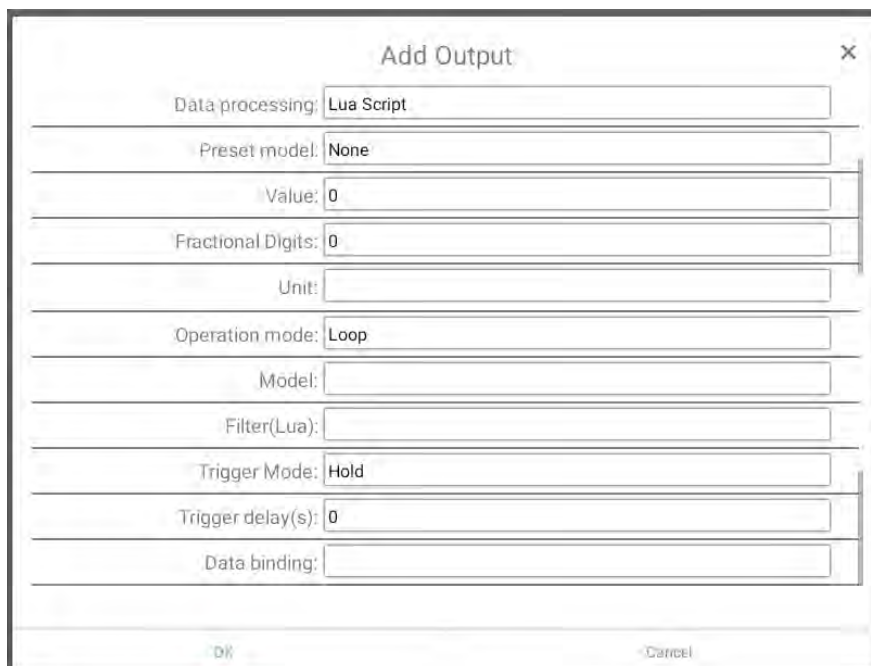

On times(ms): If the value is lower than the set minimum value, the IO signal can be output to the outside for a period of time (on time).

If the value is higher than the set minimum value, the IO signal output is turned off after the on time has elapsed.

If the value is higher than the set maximum value, IO is stopped immediately.

Data binding: Bind the path to the appropriate analog output module.

Data processing is (C) Lua Script. Preset model is None.

Value: Output fixed value.

Fractional Digits: Number of decimal places.

Unit: Parameter unit.

Operation mode: Loop (Periodically acquires and outputs signals at set intervals), Stop (Turn off the signal output of this channel), Once (Turns off after executing one signal output).

Model:

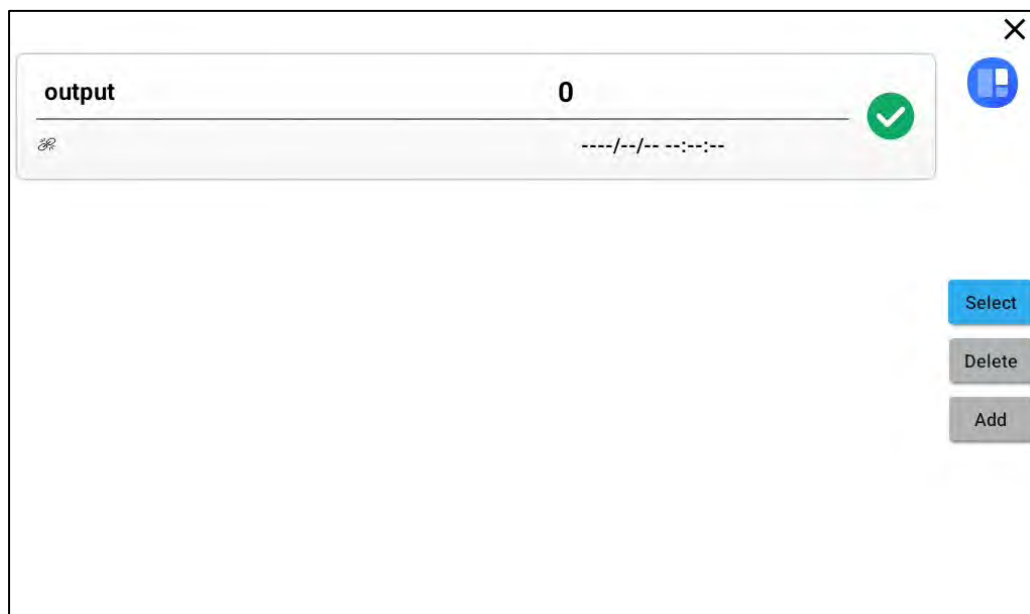

Lua Script:

Trigger Mode: Hold, Rising edge, Falling edge

Trigger delay(s): Script triggered delay

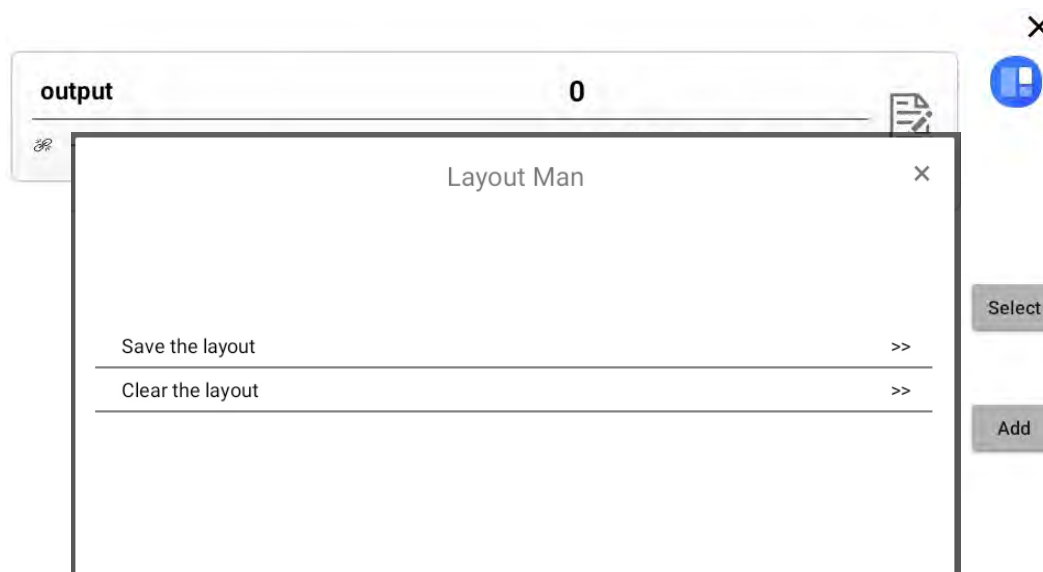

Data binding: Bind the path to the appropriate analog output module.

Delete panel

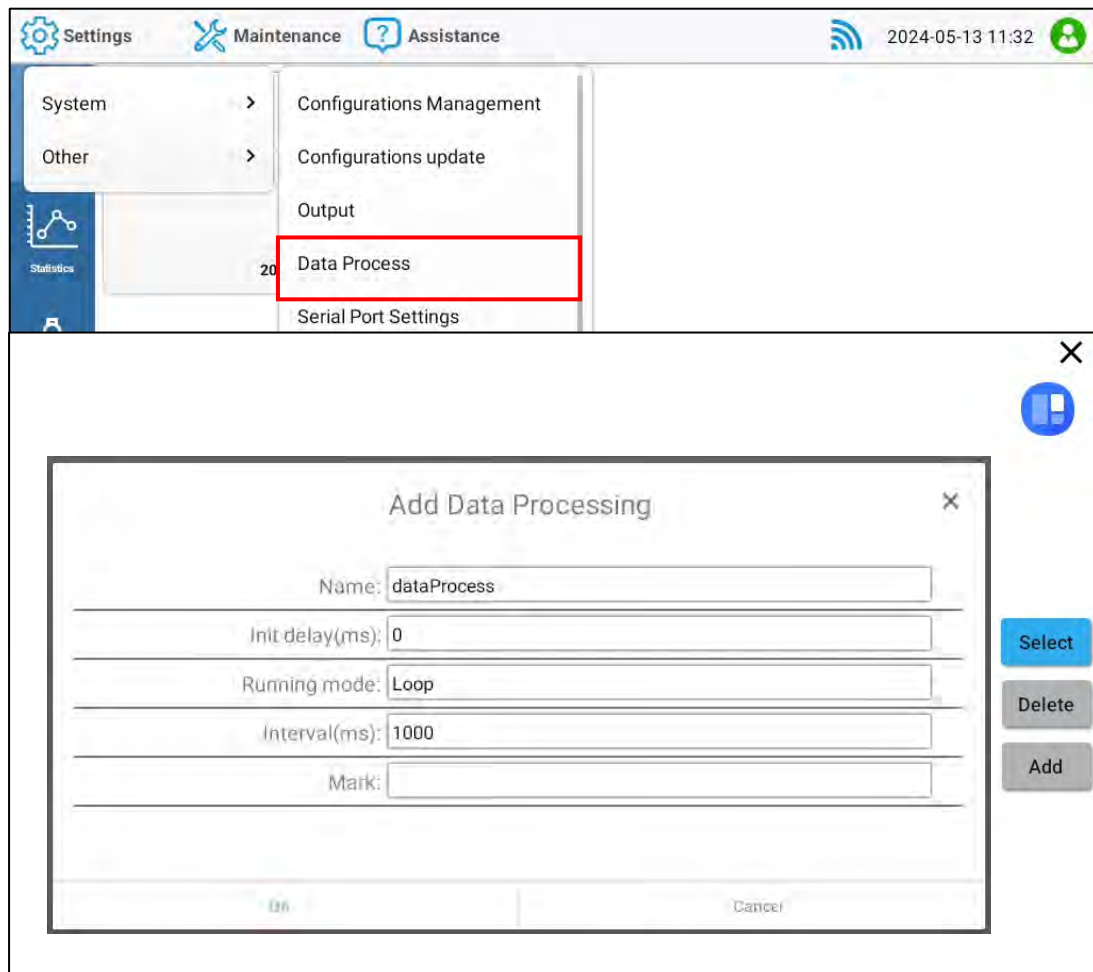

Click the Select, and choose the panel witch you want to delete, then click the Delete

Save the layout

If the configuration has changed, you must click the icon  in the upper right corner and select Save Layout. Otherwise, the settings will be invalid after powering off and restarting the device.

7.6.4 Data process

Data processing is a data processing unit with multiple inputs and outputs, and the processing logic is a custom Lua script.

Name: Name of the parameter, not repeatable.

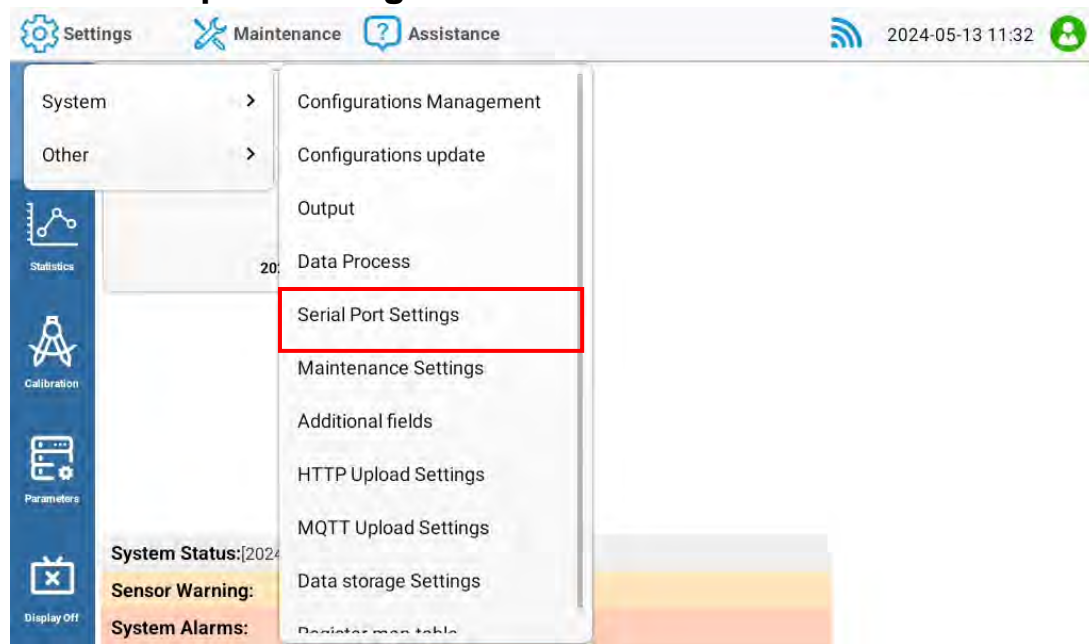

Init delay(ms): Script start delay.

Run mode: Loop, Once.

Interval(ms): interval between loop executions.

Marker: Remarks information.

7.6.5 Serial port settings

Serial Port Settings

ID: 32

Baud rate: 9600

Data bit: 8

Stop bit: 1

Parity bit: None

OK

Cancel

ID: ID of the meter controller as a slave, default 32

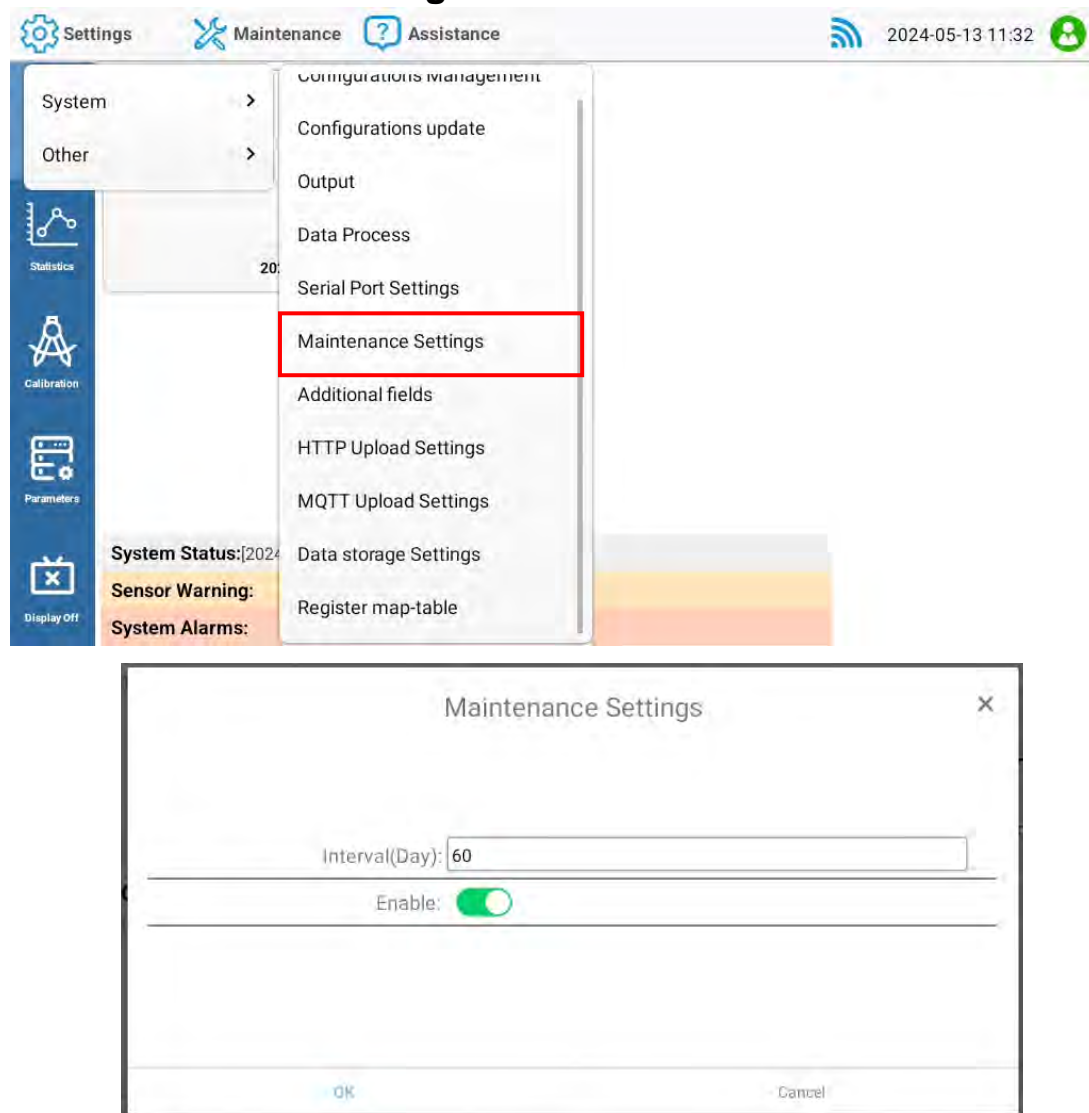

Baud rate: Baud rate of meter controller, default 9600

Data bits: 8

Stop bit: default 1

Check Bit: None, Odd, Even, Default None.

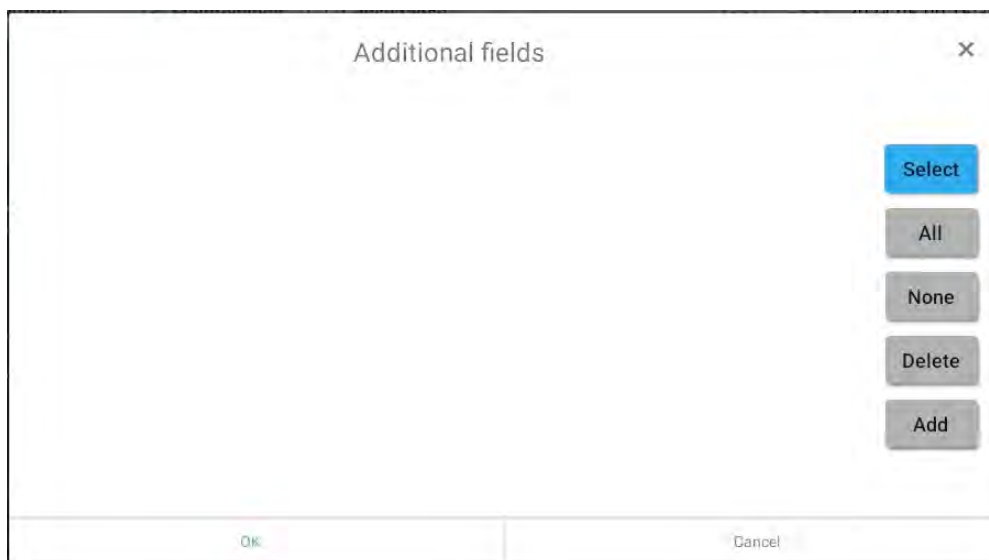

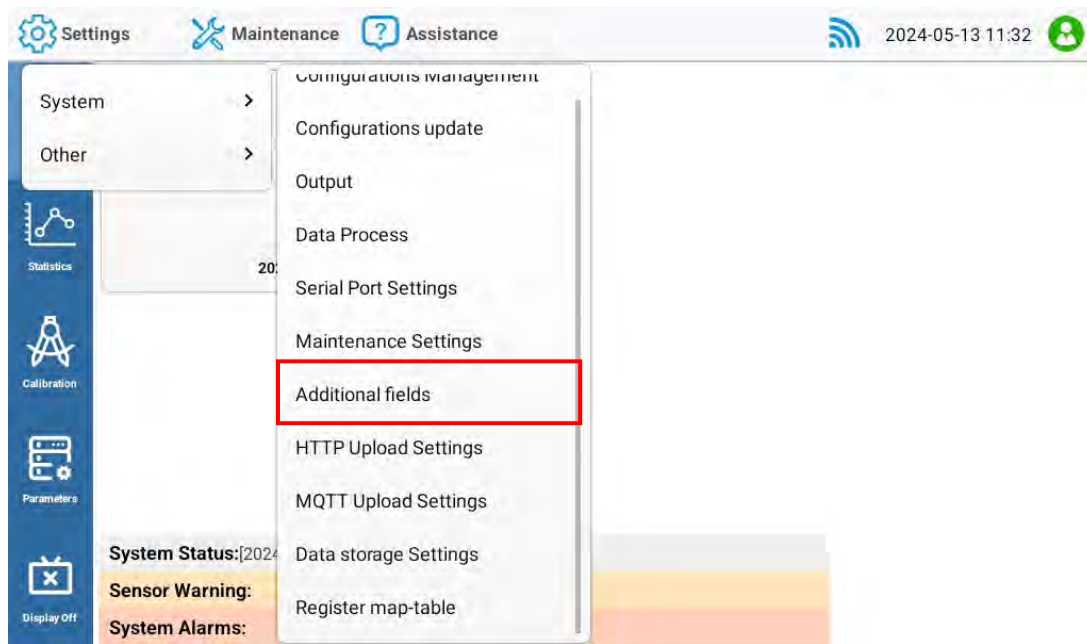

7.6.6 Maintenance settings

Interval(Day): Setting up maintenance intervals.

Enable: Maintenance tips on or off switches.

7.6.7 Additional fields

Key: Field name.

Value: Field content.

Select: Enter panel edit mode.

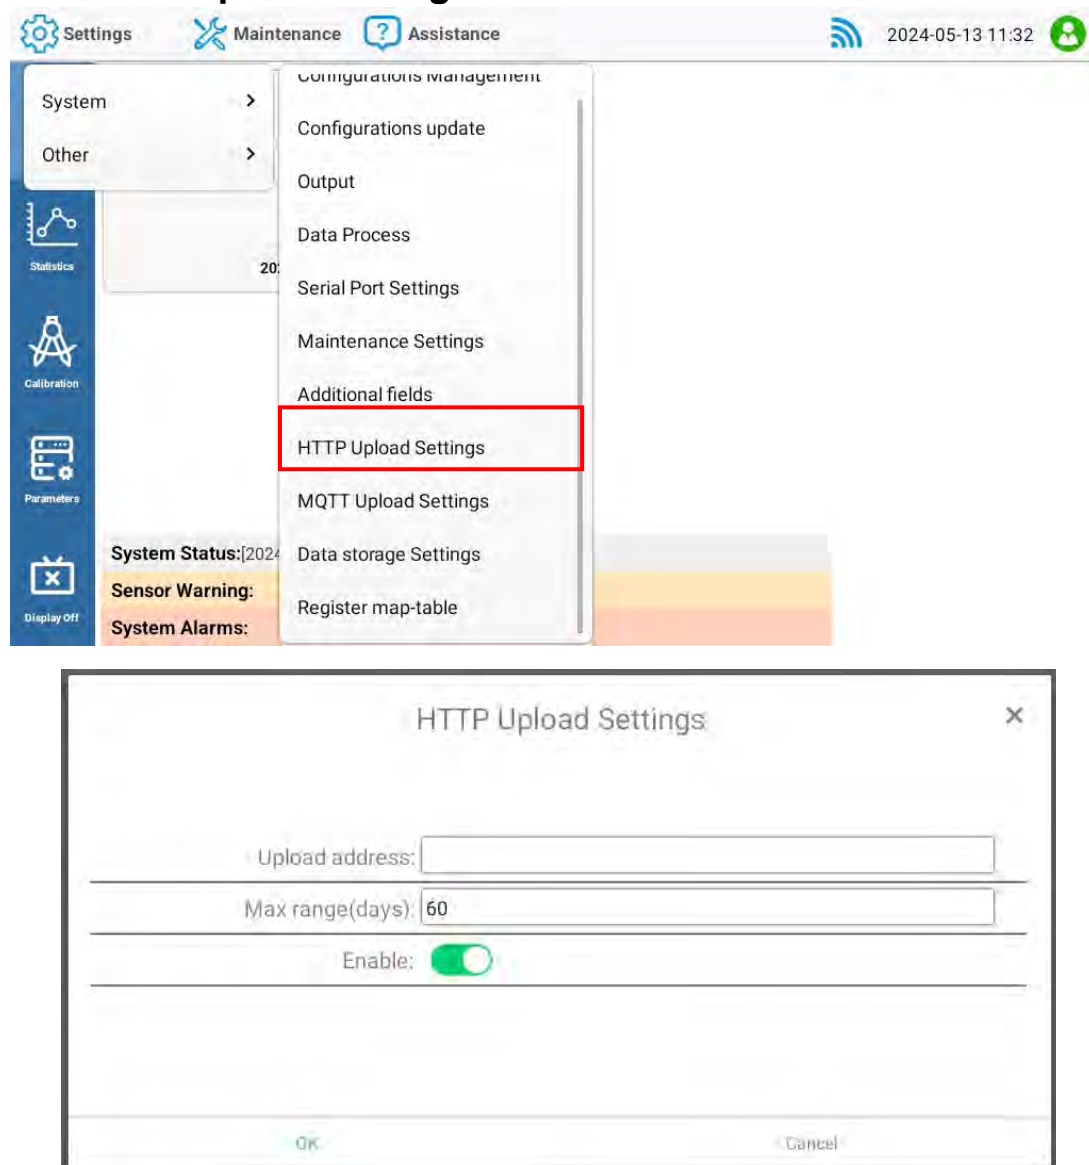

All: Select all.

None: Not choose any of them.

Delete: Delete the selected field.

Add: Adding fields.

7.6.8 HTTP upload settings

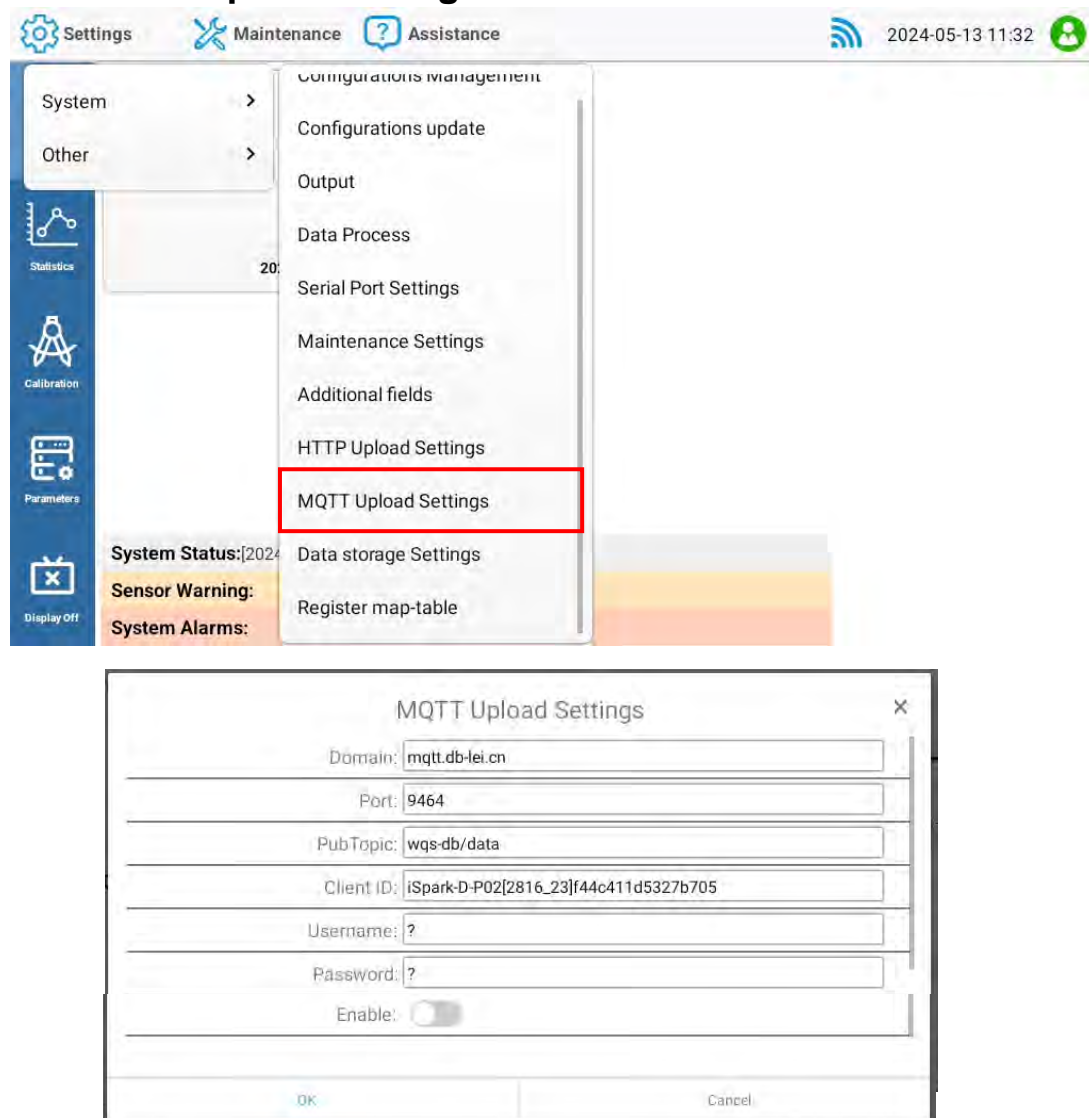

Upload address: Http access address with port information.

Max range(days): If the data upload fails and the data is uploaded normally again, the device will send the data within the number of days set on the data storage card. The maximum setting is 365 days.

Enable: HTTP data upload function switch.

7.6.9 MQTT upload settings

Domain: Mqtt server domain name or IP address.

Port: Server port, range 0-65535.

Pub Topic: The target topic for uploading data, if empty, no upload.

Client ID: ClientID used to connect to the MQTT server, automatically generated by default.

Username: Mqtt user name.

Password: Mqtt user password.

Enable: MQTT upload function switch.

7.6.9.1 MQTT message format description

Message content is in standard JSON format, in the root node, containing fixed key-value pairs:

Upload time field:

"Timestamp": 1640966400

Device category number field:

"ProVerSN": 1

Device serial number field:

"DevSN": 1

The Panel Information list field:

"SubDevs": [array]。

If the meter controller's analysis page is configured with COD, TUR, and TOC panels whose data names are COD, TUR, and TOC, respectively, the following key/value pairs are also included in the message:

Analysis page panel 1:

"COD": 0.000

Analysis page panel 2:

"TUR": 0.000

Analysis page panel 3:

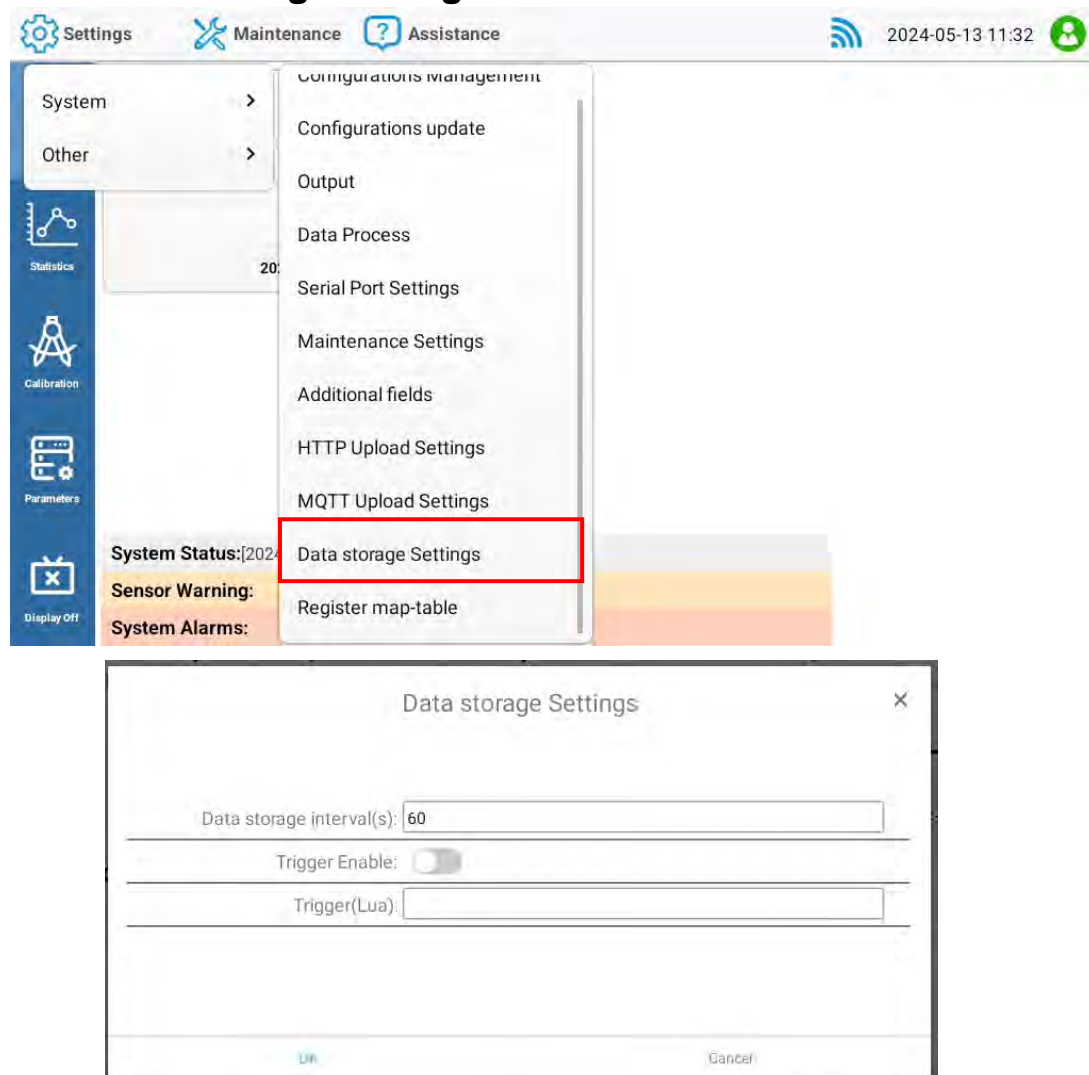

" TOC": 0.000

Additionally, if there are custom key-value pairs in the additional fields, they are also added to the JSON root node.

Example message:

```
{
  "Timestamp":1645084458,
  "ProVerSN":1,
  "DevSN":1,
  "COD":17.234,
  "TUR":2.234,
  "TOC":6.234,
}
```

7.6.10 Data storage settings

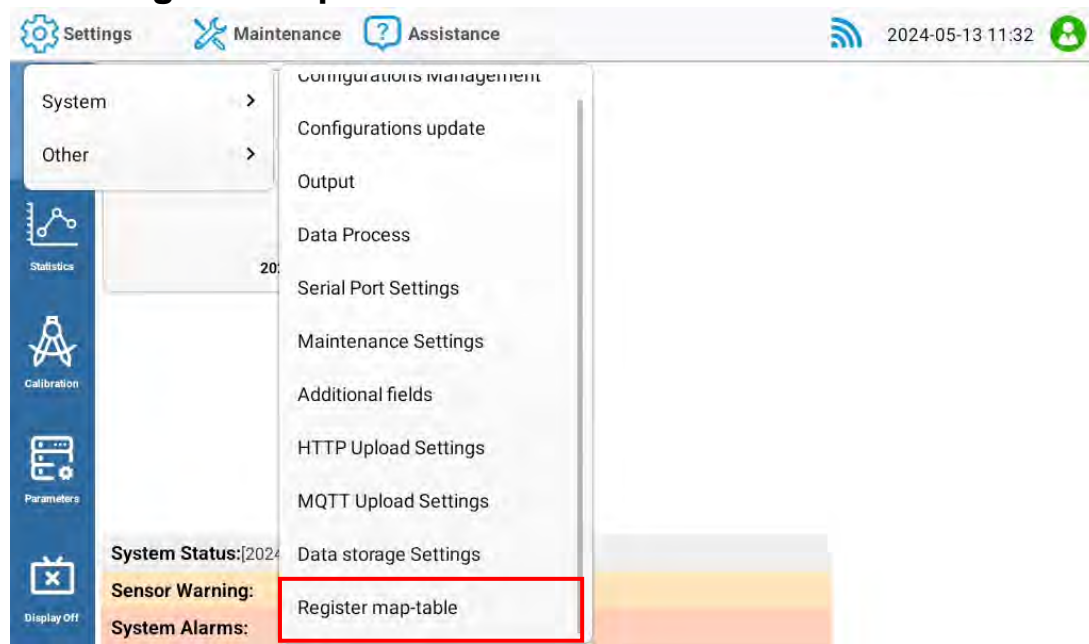

Data storage interval(s): Data storage interval in the statistics page, unit s.

Default 60s.

Trigger Enable: Script trigger on or off switch.

Trigger(Lua): Lua script.

7.6.11 Register map-table

Name	Address	PLC_Address	Type
pH	36864	49001	FloatCDAB
Temp	36866	49003	FloatCDAB

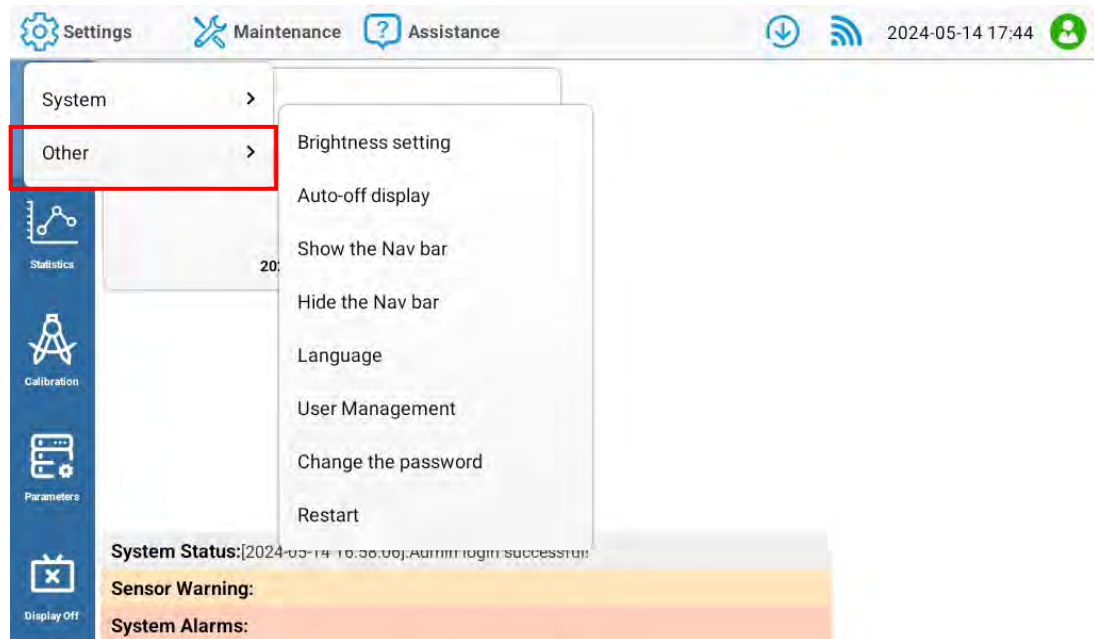

Name	Address	PLC_Address	Type
pH/Status	1024	41025	Int16AB
Temp/Status	1025	41026	Int16AB

This device can be used as a slave for other devices to read the data of this device. The panel order of the analysis page corresponds to the register address, and you can view the register address and format of the specific parameter according to the data mapping table.

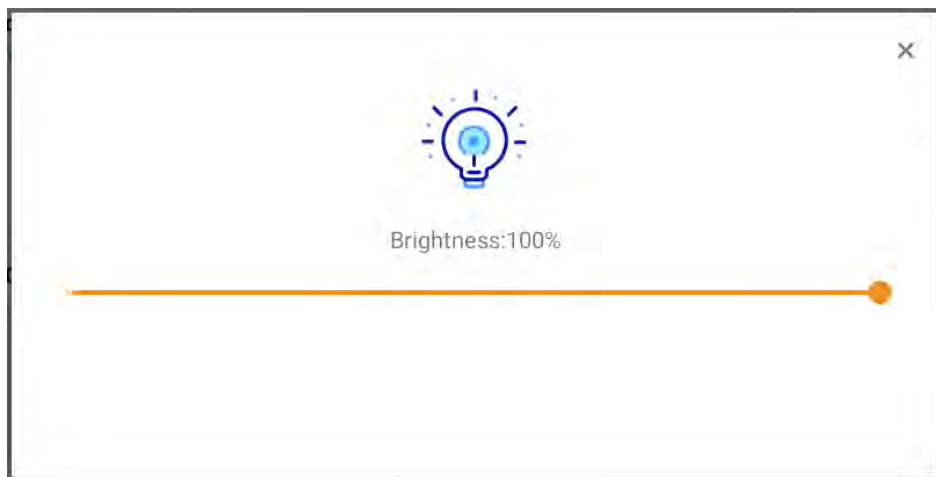

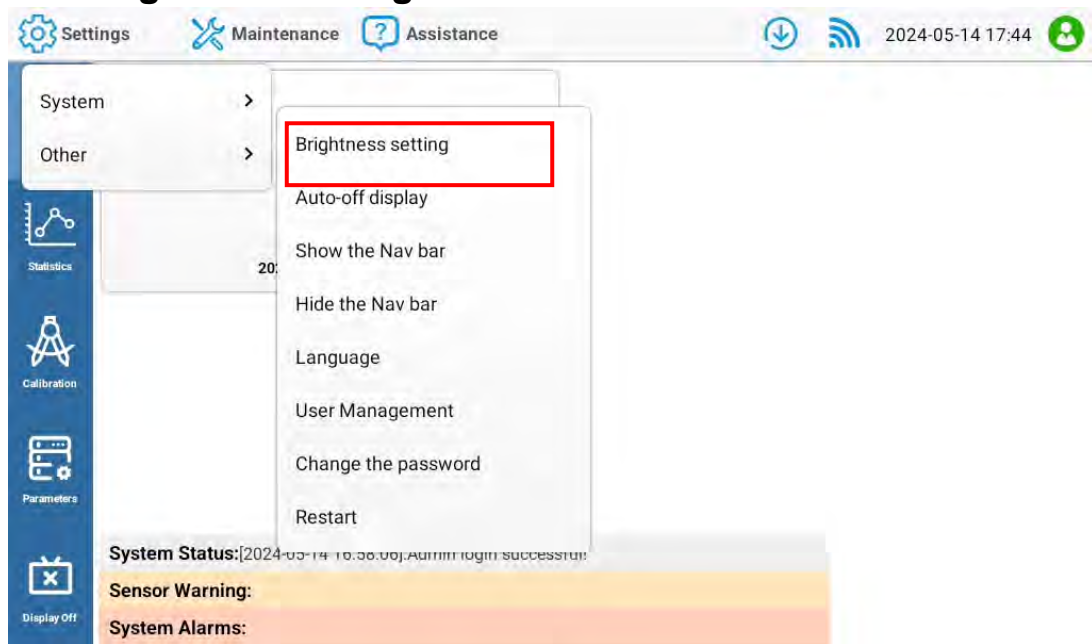

The status register is generated automatically only when the Analysis page panel is added with different upper and lower limits set. Refer to Section 7.6.1.2 Analysis page management for analysis page settings.

Code	Instruction
0	Parameters are normal
1	Upper limit exceeded
-1	Lower limit exceeded
-100	Device disconnected

7.7 Other

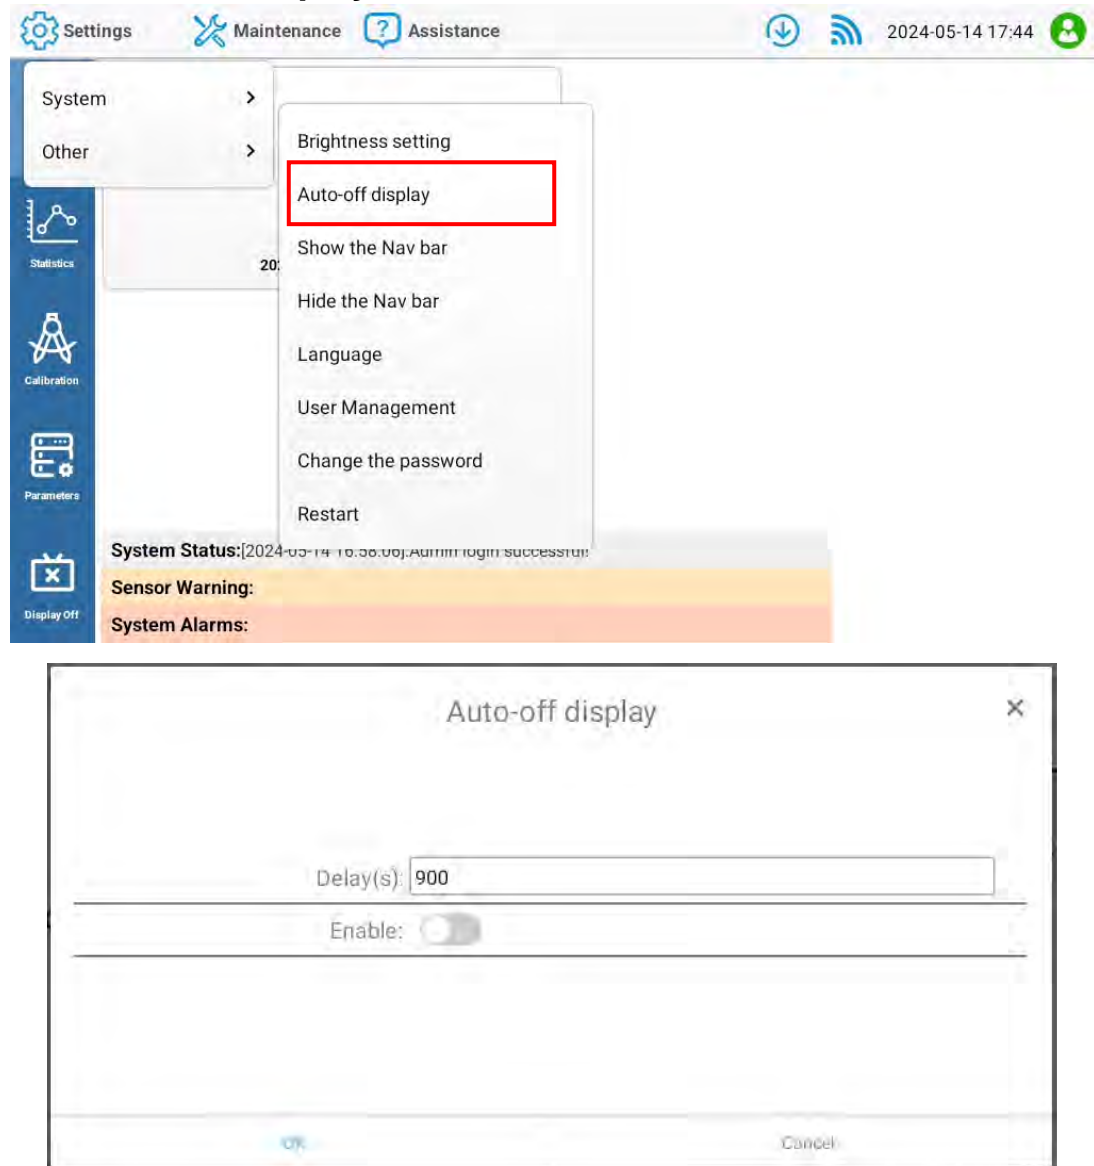

7.7.1 Brightness setting

Brightness setting adjusts the screen brightness.

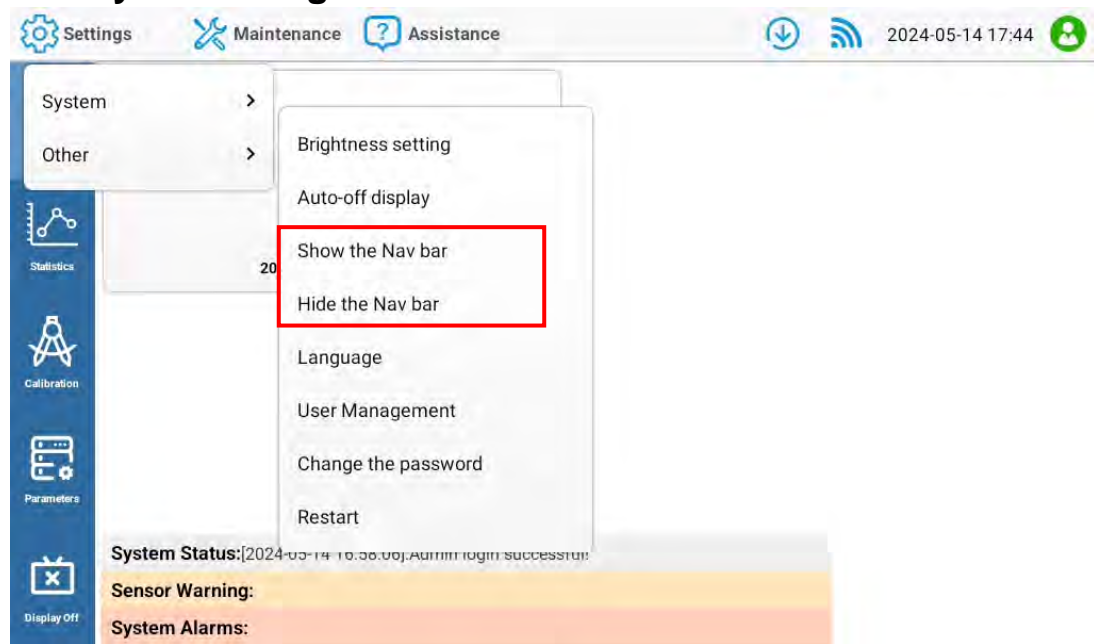

7.7.2 Auto-off display

Delay(s): automatically rests the screen after no operation.

Enable: automatically enable or disable enable.

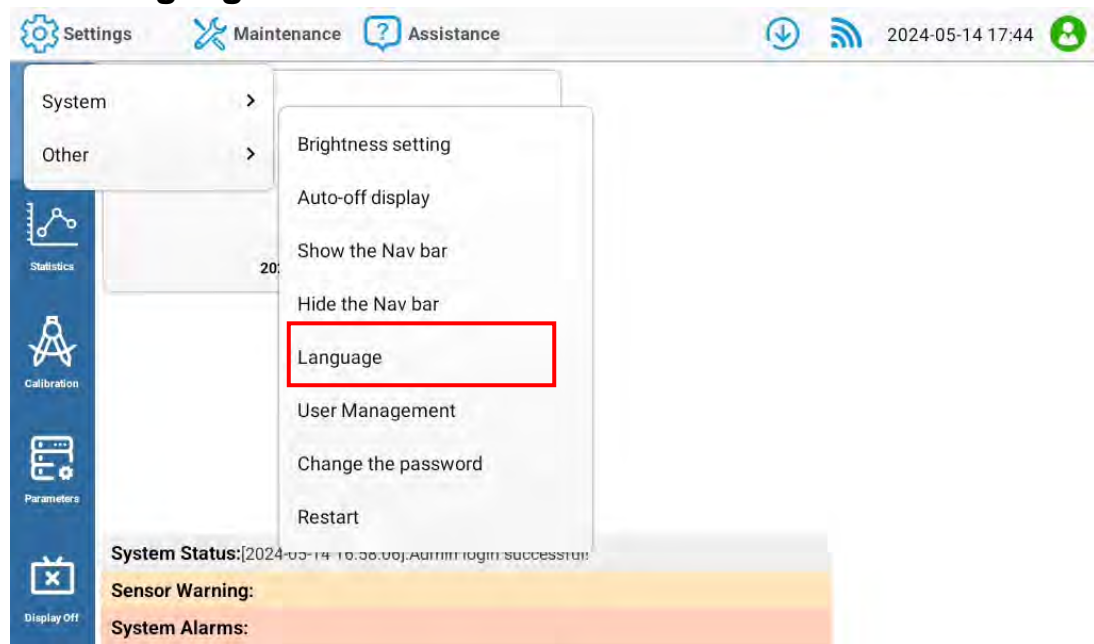

7.7.3 System navigation bar

Show the nav bar: Show system navigation bar.

Hide the nav bar: Hide system navigation bar.

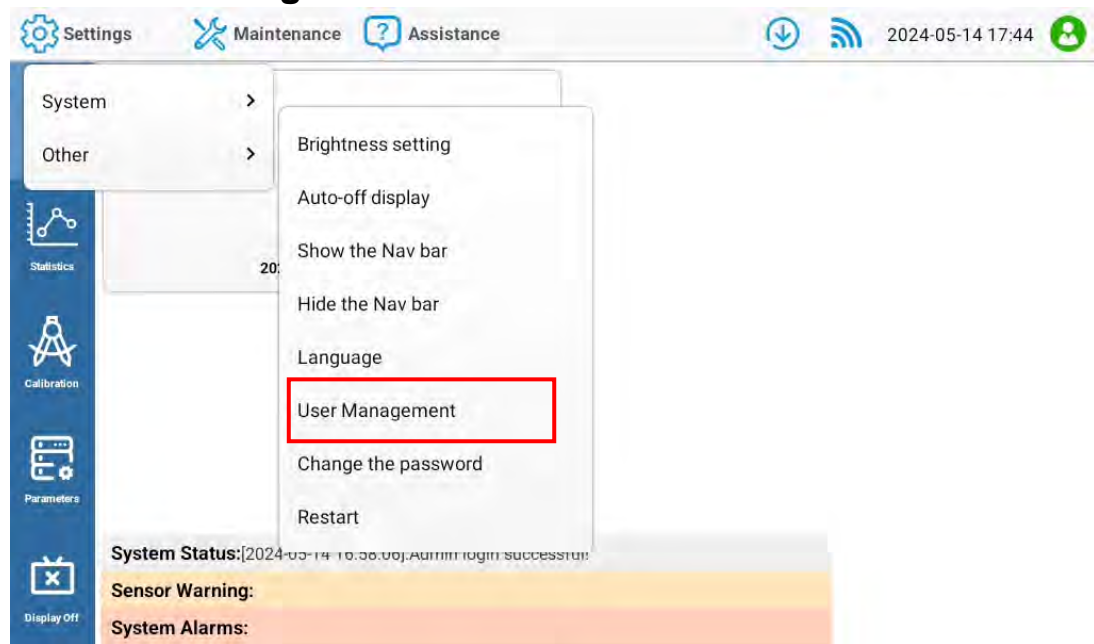

7.7.4 Language

English, Simplified Chinese, Français are currently supported.

Note: The language of the custom section of the page layout is governed by the text in the configuration manager.

7.7.5 User management

Use this function to assign sub-accounts, only administrator privileges can use this function.

Key: Sub-account name

Value: Password of the sub-account

Select: Enter panel editing mode

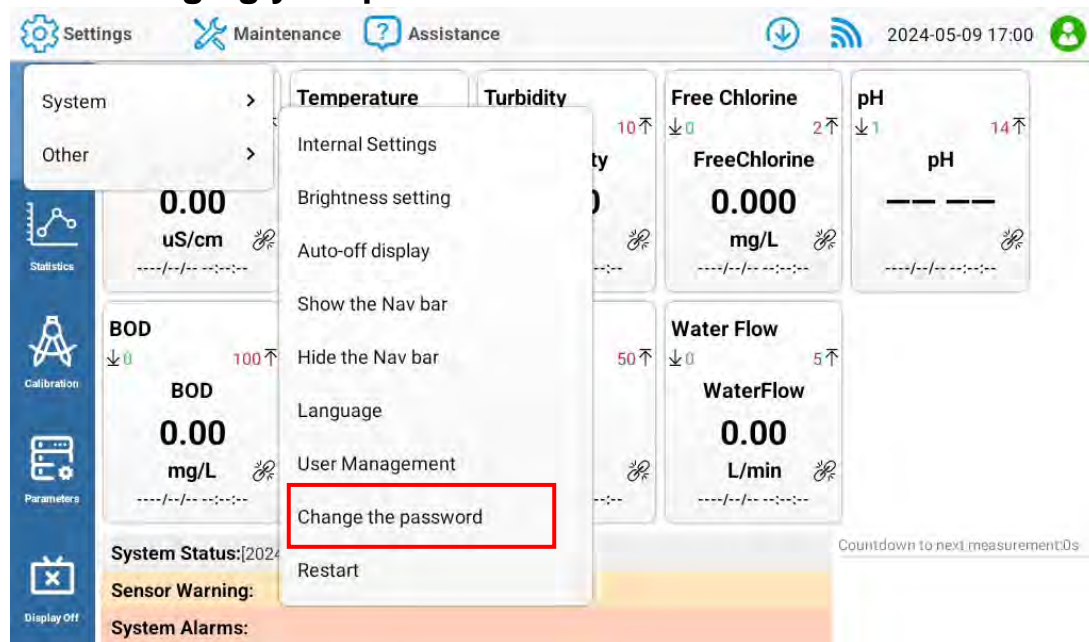

All: Select all

None: None of the selected fields

Delete: Delete the selected fields

Add: Add field

7.7.6 Changing your password

Change the password

Username:

Engineer

Current Password:

New Password:

Confirm Password:

OK

Cancel

Note: This function is only available to administrators.

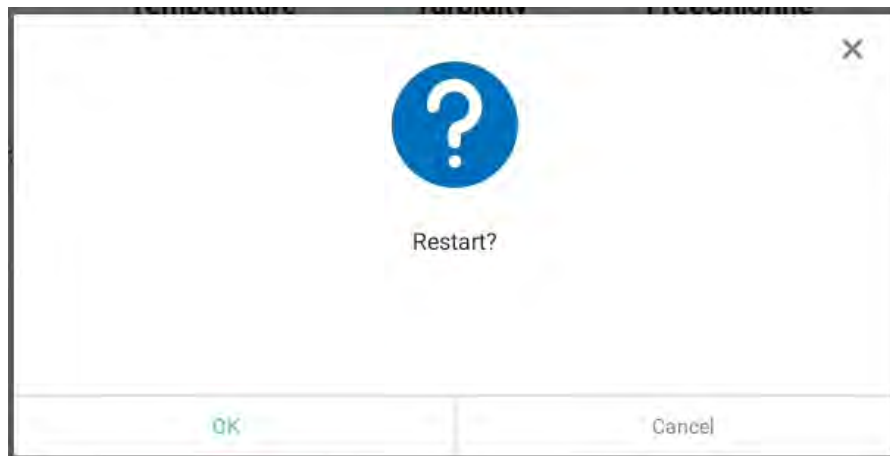

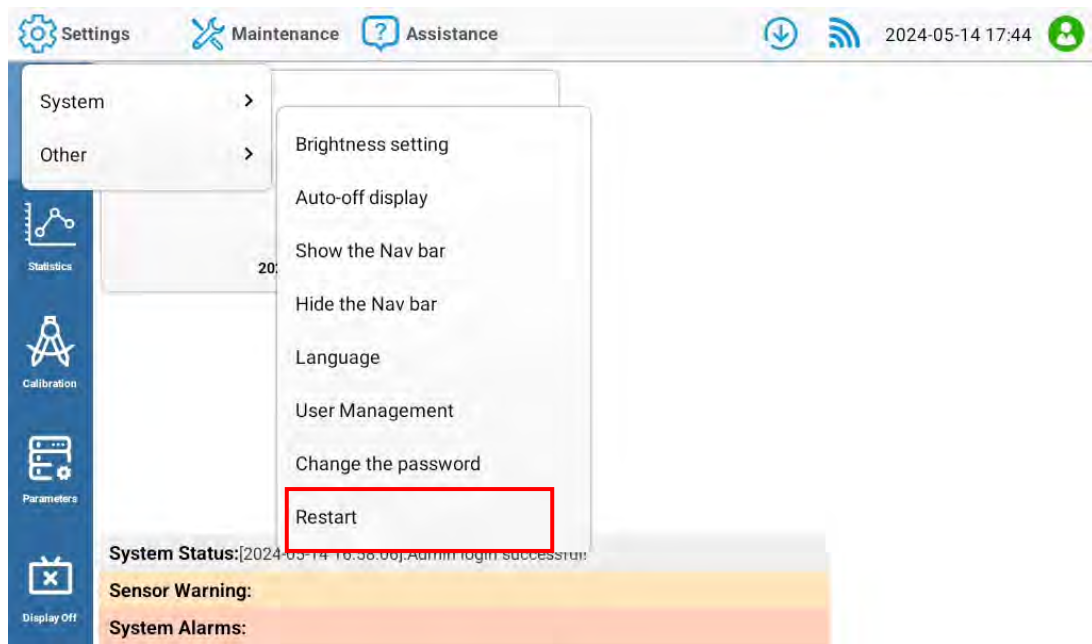

Username: the account that needs to change the password, only the engineer and administrator accounts.

Current password: the current account password, engineer default: 123456; administrator default: 12345678.

New password: the password to be changed.

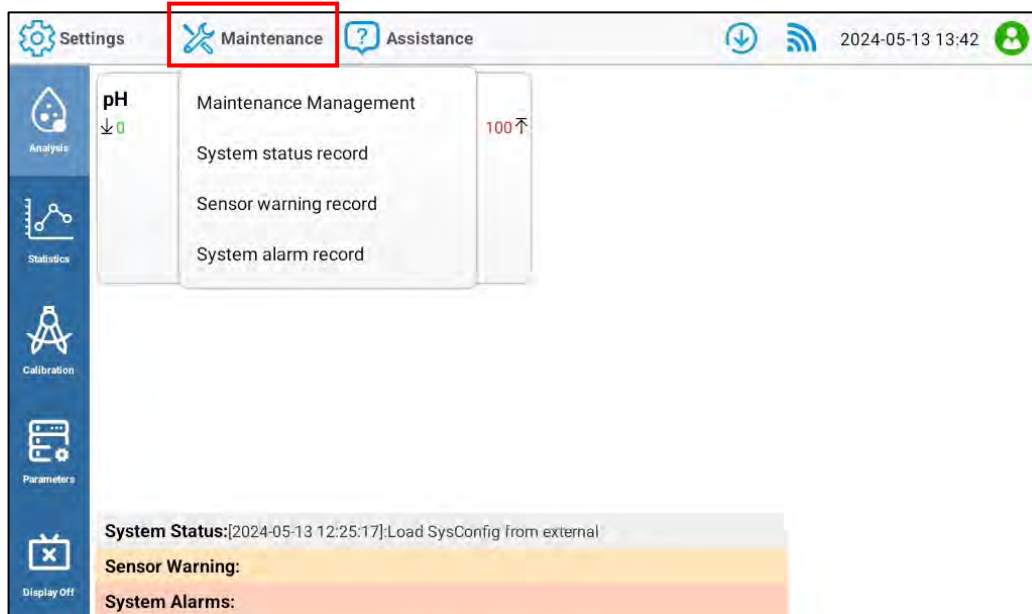

Confirm password: Re-enter the password to be changed.

7.7.7 Restart

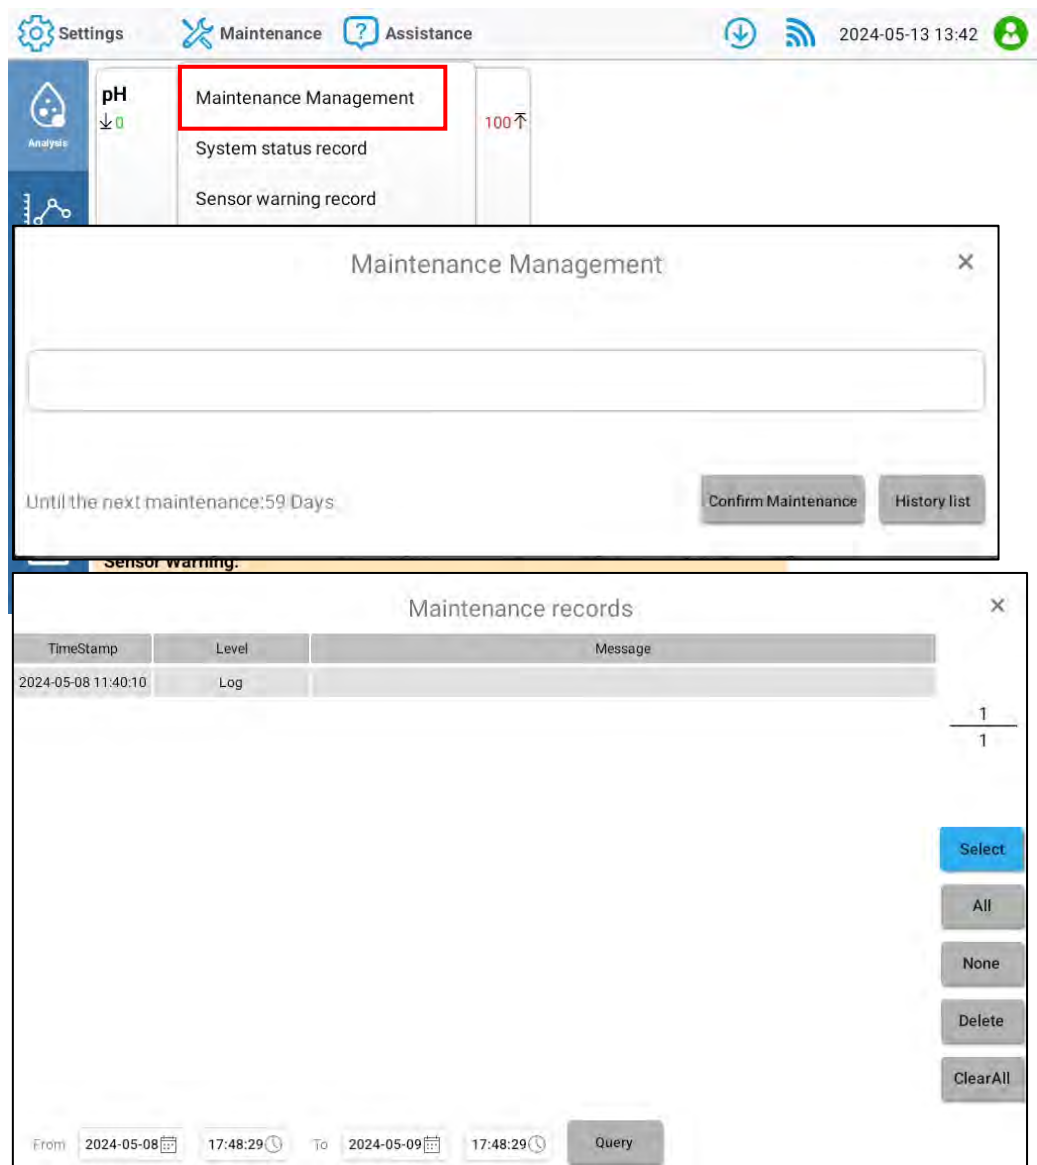

Restart the device.

7.8 Maintenance

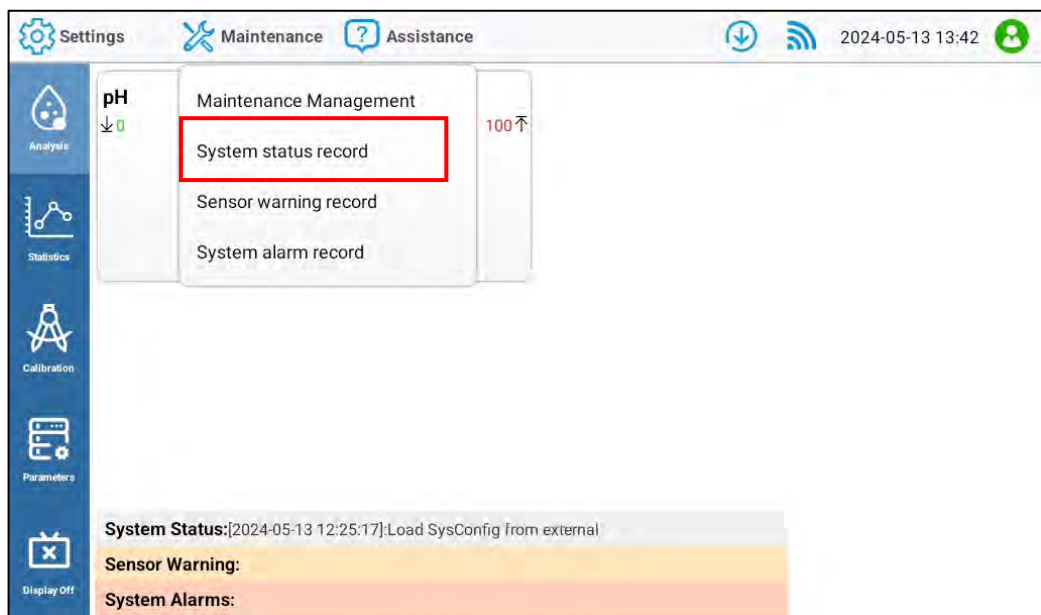

7.8.1 Maintenance Management

During the maintenance, you can write the corresponding maintenance log in the input field. After clicking Confirm Maintenance, the device records and saves the maintenance log, and you can view or delete the maintenance log in the history list.

7.8.2 System status record

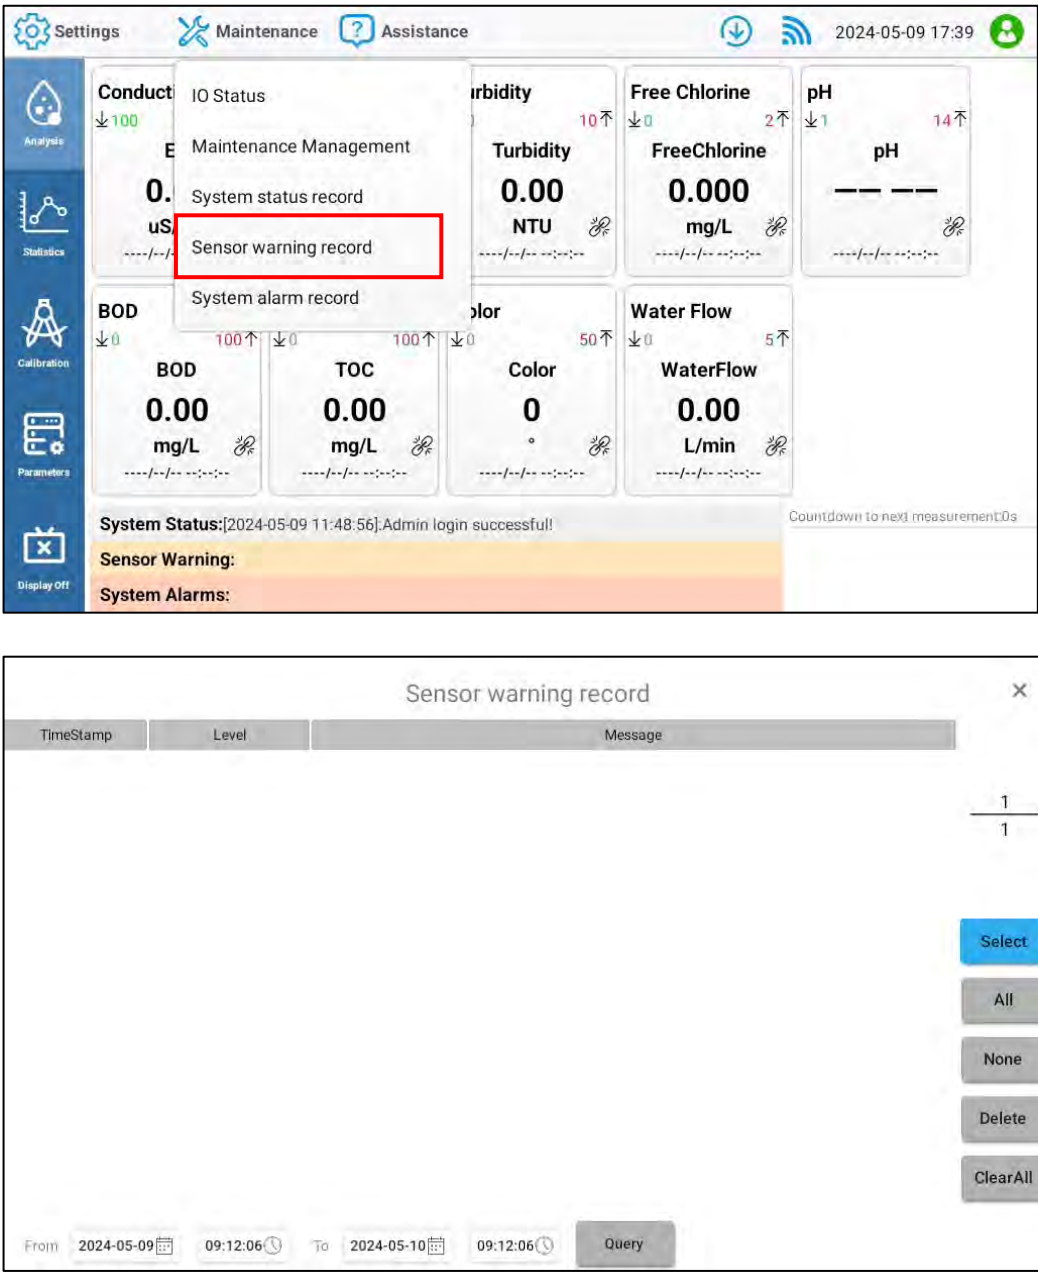

System status record				
TimeStamp	Level	Message		
2024-05-09 11:48:56	Log	Admin login successful!	1	
2024-05-09 11:43:28	Log	Engineer login successful!	1	
2024-05-09 11:40:33	Log	Admin login successful!	1	
2024-05-09 11:40:21	Log	Engineer login successful!		
2024-05-09 11:40:09	Log	Admin login successful!		
2024-05-08 16:25:53	Log	Load SysConfig from external		Select
2024-05-08 16:22:53	Log	Load SysConfig from external		All
2024-05-08 16:22:09	Log	Load SysConfig from external		None
2024-05-08 16:15:01	Log	SuperAdmin login successful!		Delete
2024-05-08 16:14:09	Log	Load SysConfig from external		ClearAll

From: 2024-05-08 17:53:56 To: 2024-05-09 17:53:56 Query

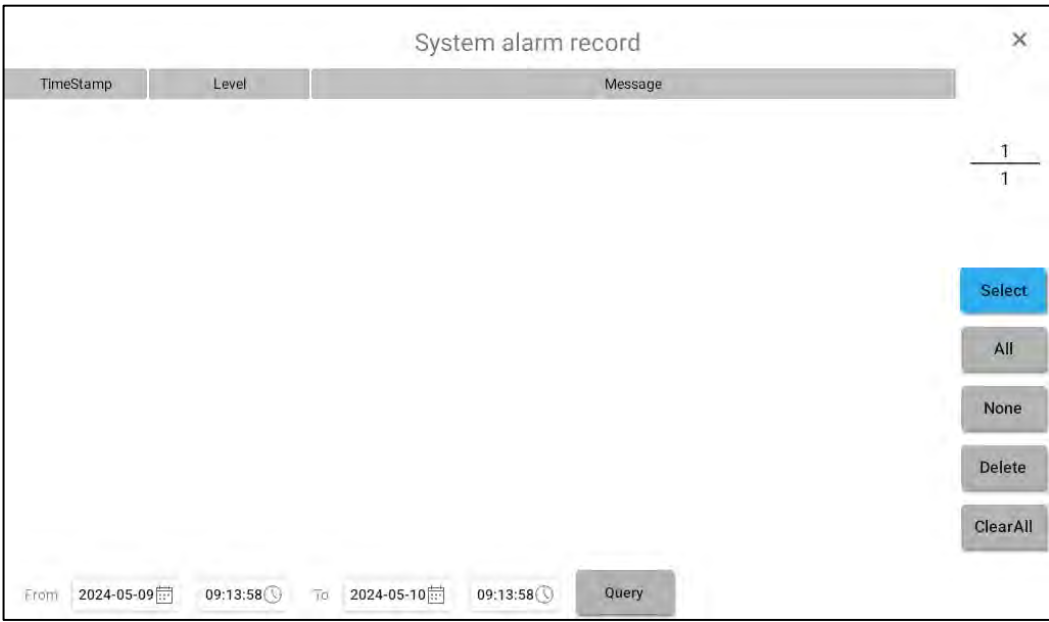

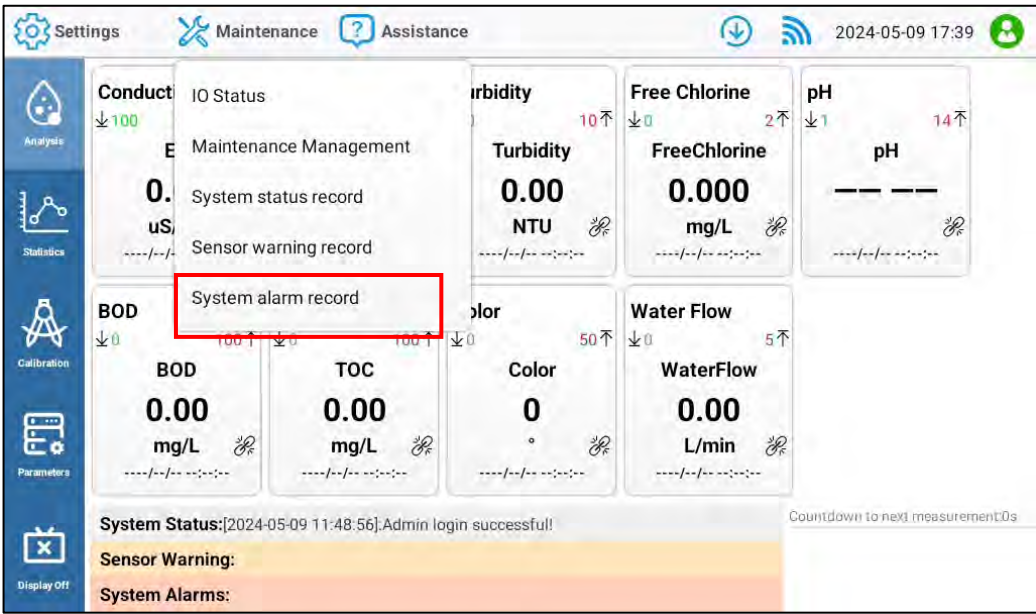

This function allows you to retrieve and clear the historical system status, the device stores the system status of the last week.

7.8.3 Sensor warning record

Historical sensor alerts can be viewed and cleared in this function, and the unit will store the most recent year's sensor alerts.

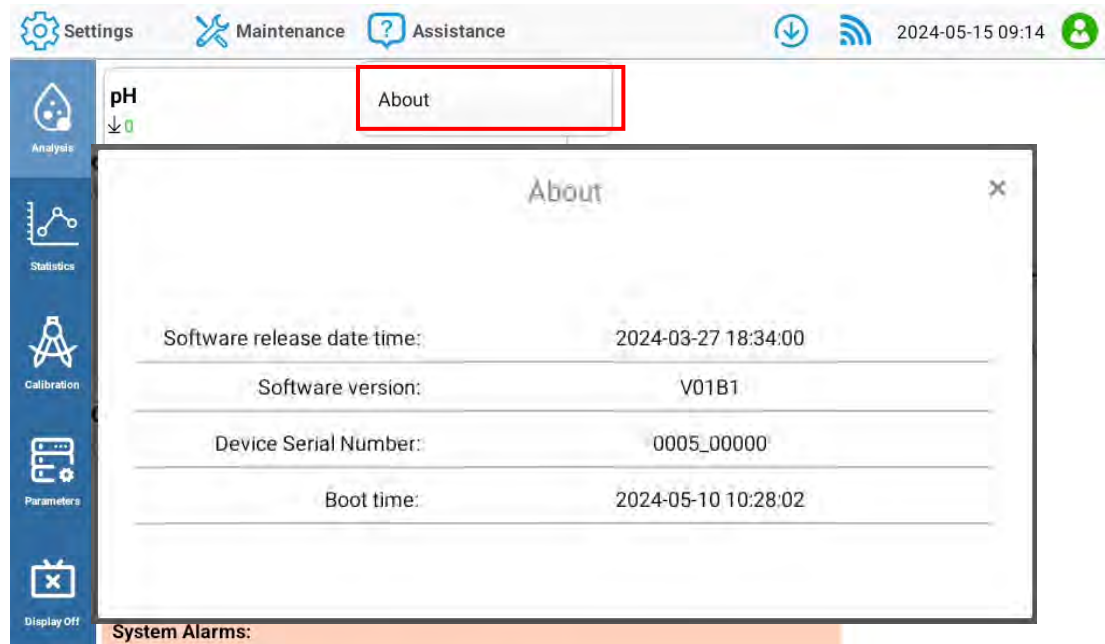

7.8.4 System alarm record

Historical system alarms can be viewed and cleared in this function, and the unit stores the most recent year's system alarms.

7.9 Assistance

7.9.1 About

Software release date time: The current software release date.

Software version: The current software version number.

Device serial number: Device version number and device serial number.

Boot time: The time at which the device was started, which can be used to determine the time of this run.

8 MC-W-S register table

Register Type: Holding registers (4x).

Supported Function Codes: 0x03/0x06/0x10/0x0F.

8.1 Basic register table

Register name	Address	W/R	Data type	Explanation	Note
ProVerSN	0x8000	R	U16	Product Model version number	0x0001
DevSN	0x8001	R	U16	Product Serial No	[1-65535]
ModbusID	0x8002	W/R	U16	Modbus RTU communication address	[0-253]
COM_BaudRate	0x8003	W/R	U32 (CDAB)	RS485 Serial communication baud rate	4800 9600 115200
	0x8004				

8.2 Panel register table (example)

MC-W-S support PLC address access, 0x9000 corresponds to 49001 address, and other addresses are accessed by offset;

The following table is only an example, please refer to the actual user configuration.

Register name	Address	PLC Address	W/R	Data type	Explanation
COD (example)	0x9000	49001	R	Float32 (CDAB)	User Defined Panel 1
	0x9001	49002			
TUR (exmaple)	0x9002	49003	R	Float32 (CDAB)	User Defined Panel 2
	0x9003	49004			

8.3 MC-W-S command table (Development based on Modbus RTU 0x0F instruction)

CMD	Addr.	Instruction code	Data type	CMD code. High 8bit	Cmd code. Low 8bit	Explanation	return
Restart	0x0000	0x0F	U16	0x10	0x01	Restart	None
SaveF	0x0000	0x0F	U16	0x11	0x01	Save parameters	Standard Modbus

9 Analog current output

The content of this chapter currently only supports the device MC-W-S-P05. The MC-W-S-P05 includes the analog current expansion module CVT-D-C (4-20 mA). A single module supports up to 2 outputs. The MC-W-S converts the target panel value to the analog current value by running the Lua script. The MC-W-S controls the current output of the module with the Modbus protocol, so that the specified data can be output with the current.

Next, we will use the COD in the input panel as the data source, the output page will continuously convert the COD to 4~20 mA, and send it to the expansion module CVT-D-C.

9.1 Add output panel

CVT-D-C communication parameters:

Name	Default
ModbusID	64
Baud rate	9600
Data bits	8
Stop bits	1
Parity bit	None

CVT-D-C output control register:

Register name	Address	W/R	Data type	Explanation
set1_mA	0x9004	W(06/16)	Float32(CDAB)	
	0x9005			
set2_mA	0x9006	W(06/16)	Float32(CDAB)	
	0x9007			

Please add this device in Device Management based on the above information, and also configure the COD output panel in the output page.

For more detailed instructions, please refer to the CVT-D-C user manual.

Configurations Management

36870	Set2_mA	Float	CDAB	0	

Select

9.2 Edit the data model

Converts the target value to a current value:

$$I_{out} = \frac{V_t - V_{min}}{V_{max} - V_{min}} \times (I_{max} - I_{min}) + I_{min}$$

Where I_{out} is the current output value, V_t is the target value to be converted, V_{min} is the minimum value, V_{max} is the maximum value, I_{max} is the maximum current value, and I_{min} is the minimum current value.

Example:

1 Lua Script

Assuming the pH value range is 0~14, the corresponding current output: 4~20, according to the formula to get:

$$\frac{pH - 0}{14 - 0} \times (20 - 4) + 4$$

Data source is bound to the pH parameter of the analysis page and Data binding is bound to the output path of the 4-20 mA module. Select Lua Script for Data processing in the output panel editing., find the model and enter the simplified equation:

$$pH * 16 / 14 + 4$$

Script:

```
function main() return pH*16/14+4 end
```

In this way, the meter will periodically convert the target value into a current value and output it by CVT-D-C.

10 Troubleshooting

WARNING

Handle faults and alarms in strict accordance with the manual. If you cannot solve them, please contact a technician.

Symptom	Possible Cause	Solution
Unable to connect to WiFi	Password error	Reconnect to WiFi and enter the correct password
	WiFi switch is not turned on.	Please enter the Wi-Fi setting interface and manually turn on the WiFi switch
Unable to connect to default WiFi	Wait less than 3 minutes after power on.	Please wait for 3 minutes at least
	Not connected after 3 minutes.	Please contact technical support
Unable to connect to the internet	Connect to customer-provided WiFi.	Please check the network status of the customer-provided WiFi.
	4G antenna is not installed.	Please install the 4G antenna
	No 4G card inserted or no signal.	Please replace the 4G card or contact technical support
Data export failure	SD card or USB flash drive not accessed	Check if SD card or USB flash drive is inserted
	Insufficient space remaining on SD or USB flash drive	Check the remaining space on the SD card or USB flash drive
Unable to upload data	No network connection	Check network settings
	Error upload parameter configuration	Check the configured parameters
